EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 419
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A developer needs to deploy the code for a new application on an AWS Lambda function. The application needs a dependency file that is 500 MB to run the business logic.

Which solution will meet these requirements?

A. Compress the application code and dependencies into a .zip file. Directly upload the .zip file as a deployment package for the Lambda function instead of copying the code.

B. Compress the application code and dependencies into a .zip file. Upload the .zip file to an Amazon S3 bucket. Configure the Lambda function to run the code from the .zip file in the S3 bucket.

C. Package the application code and dependencies into a container image. Upload the image to an Amazon S3 bucket. Configure the Lambda function to run the code in the image.

D. Package the application code and dependencies into a container image. Push the image to an Amazon Elastic Container Registry (Amazon ECR) repository. Deploy the image to the Lambda function.

Selected Answer: B

I think the question should have been more specific about the size of the code. The solution D is always correct. The solutiuon B is correct if the uncompressed size is less than 512MB. In the question was not specified the size of the code. In my experience is rarely to have a micoreservice code size more 12MB.

Selected Answer: B

If the dependency file is too large for a Lambda layer (i.e., greater than 250 MB when compressed), store the file in an Amazon S3 bucket.
In your Lambda function code, you can download the dependency file from S3 at runtime using the AWS SDK. This would ensure that the function has access to the file without exceeding Lambda's storage limits.

option D also is possible, and Lambda can run from /tmp the .zip, not inside S3 bucket. So, maybe D is correct
