EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 76
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A developer deployed an application to an Amazon EC2 instance. The application needs to know the public IPv4 address of the instance.

How can the application find this information?

A. Query the instance metadata from http://169.254.169.254/latest/meta-data/.

B. Query the instance user data from http://169.254.169.254/latest/user-data/.

C. Query the Amazon Machine Image (AMI) information from http://169.254.169.254/latest/meta-data/ami/.

D. Check the hosts file of the operating system.

Selected Answer: A

This is the correct approach. The instance metadata includes details such as the instance's public IPv4 address. The application can make a request to this URL, specifically to http://169.254.169.254/latest/meta-data/public-ipv4, to retrieve the public IPv4 address of the instance.

Selected Answer: A

The EC2 instance metadata service provides details about the instance, such as its public and private IP addresses. To find the public IPv4 address, you can query the metadata

Selected Answer: A

You can retrieve ip through http://169.254.169.254/latest/meta-data/local-ipv4 or http://169.254.169.254/latest/meta-data/public-ipv4
