EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 13
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A company receives food orders from multiple partners. The company has a microservices application that uses Amazon API Gateway APIs with AWS Lambda integration. Each partner sends orders by calling a customized API that is exposed through API Gateway. The API call invokes a shared Lambda function to process the orders.
Partners need to be notified after the Lambda function processes the orders. Each partner must receive updates for only the partner's own orders. The company wants to add new partners in the future with the fewest code changes possible.
Which solution will meet these requirements in the MOST scalable way?

A. Create a different Amazon Simple Notification Service (Amazon SNS) topic for each partner. Configure the Lambda function to publish messages for each partner to the partner's SNS topic.

B. Create a different Lambda function for each partner. Configure the Lambda function to notify each partner's service endpoint directly.

C. Create an Amazon Simple Notification Service (Amazon SNS) topic. Configure the Lambda function to publish messages with specific attributes to the SNS topic. Subscribe each partner to the SNS topic. Apply the appropriate filter policy to the topic subscriptions.

D. Create one Amazon Simple Notification Service (Amazon SNS) topic. Subscribe all partners to the SNS topic.

Selected Answer: C

Option C is the most scalable way to meet the requirements. This solution allows for a single SNS topic to be used for all partners, which minimizes the need for code changes when adding new partners. By publishing messages with specific attributes to the SNS topic and applying the appropriate filter policy to the topic subscriptions, partners will only receive notifications for their own orders. This approach allows for a more flexible and scalable solution, where new partners can be added to the system with minimal changes to the existing codebase. Option A and D may not be scalable when there are a large number of partners, as creating a separate SNS topic for each partner or subscribing all partners to a single topic may not be feasible. Option B may result in a large number of Lambda functions that need to be managed separately.

Selected Answer: C

OptionC: With SNS Filter policy subscription will identify that this need to read or not and while adding new customer no code change is just create subscription with filter of partnerid

Selected Answer: C

A) Eliminated - Every time a new partner is added, a new SNS topic needs to be created. This requires manual configuration and updates to the infrastructure.

upvoted 3 times

sumanshu 1 year, 3 months ago

B) Eliminated - Adding a new partner means creating a new Lambda function, increasing operational overhead.

upvoted 2 times

sumanshu 1 year, 3 months ago

C) Correct - A single SNS topic is used. The Lambda function publishes messages with attributes (e.g., partner ID). Each partner subscribes to the SNS topic and uses a filter policy to only receive messages relevant to their partner ID

upvoted 2 times

sumanshu 1 year, 3 months ago

D) Eliminated - All partners would receive updates for all orders because there is no filtering mechanism to ensure partner-specific messages.

Selected Answer: C

keyword: MOST scalable way, only the partner's own orders

==> Discard A: you must update lambda for new topic added, but it simple for case having few partners, and little change
==> Discard B: You must create duplicate lambda function and maintain it. But best case for customized comlexity requirements
==> Discard D: it is easy to scalable, but violate rule 'only the partner's own orders', when a partner can see msg of all anothers

C: best choice, match with 2 keywords above

Selected Answer: A

because of the fact that By default, you can have up to 200 filter policies per topic, the C option can't be the wright answer, but it's the A choice. since we can go up to 100 00 topics per SNS

upvoted 1 times

AnthonyTL 1 year, 6 months ago

With C, if it's more that 200 partners, we could create another SNS for the next 200 partners. so it couls support up to 2000000 partners.

A works, but C is better, benchods. More efficient. Have to remember good curry cannot be had in a hurry

Selected Answer: C

Funny understand why some people want to create separate SNS for each partner. You have got the option to filter and send notifications to the appropriate partner.

Answer is C ... No Question

upvoted 1 times

xdkonorek2 2 years, 3 months ago

Selected Answer: A

you can create up to
10.000 filter policies per AWS account
200 filter policies per topic (not subscription!) limits option C to 200 partners
100 000 topics per AWS account, limits option A to 100 000 partners

A and C works but A has better scalability with ability to add 100 000 partners

Selected Answer: C

You can using a filter policy to just sent the info by partner

upvoted 1 times

ninomfr64 2 years, 7 months ago

Selected Answer: C

C. adding a new partner would only require to create a new subscription with the right filter

upvoted 1 times

tttamtttam 2 years, 8 months ago

Selected Answer: C

C seems the most efficient way. when you add more partners, you can just assign new codes for each partner. with the codes, you can send notifications to specific paters

upvoted 1 times

rlnd2000 2 years, 8 months ago

Selected Answer: A

The answer is A since this question has two crucial requirements:
a) ... with the fewest code changes possible.

b) ...in the MOST scalable way

ChatGPT initially gives an incorrect answer and then adjusts its response when requirements are asked.

upvoted 1 times

rlnd2000 2 years, 8 months ago

OOH another important requirement: Each partner must receive updates for only the partner's own orders, that is not achievable with option C

upvoted 1 times

Jeremy11 2 years, 8 months ago

This part of C seems to meet that requirement: Apply the appropriate filter policy to the topic subscriptions.

upvoted 5 times

Skywalker23 2 years, 6 months ago

Cannot be A. It requires change of lambda function code to send notifications to new SNS topics for new partners. Not a scalable solution.
