Exam question from Amazon's AWS Certified Developer - Associate DVA-C02

Question #: 93

Topic #: 1

[All AWS Certified Developer - Associate DVA-C02 Questions]

A developer is building an application that uses Amazon DynamoDB. The developer wants to retrieve multiple specific items from the database with a single API call.

Which DynamoDB API call will meet these requirements with the MINIMUM impact on the database?

A. BatchGetItem

B. GetItem

C. Scan

D. Query

tons of thanks.

Looking for just a single item on the main table index? Use GetItem
Looking for just a single item on a GSI? Use Query.
Looking for multiple items with different partition key and sort key combinations at once? Use BatchGetItem
Looking for multiple items that share the same partition key? Use Query

Selected Answer: A

B) Eliminated - The GetItem API retrieves only one specific item at a time by its primary key.

C) Eliminated - The Scan API retrieves all items in a table or index by sequentially scanning every item.

D) Eliminated - The Query API retrieves all items that match a specific partition key and optionally filters them by sort key or other criteria.

CustomerID OrderID OrderDetails
123 A001 Shoes
123 A002 Jacket
123 A003 Watch
If you need to retrieve all orders for CustomerID = 123, a Query would work well because all the needed items share the same partition key

Suppose you need to retrieve multiple orders, but for different customers:
CustomerID OrderID OrderDetails
123 A001 Shoes
456 B002 Laptop
789 C003 Phone
Here, the partition keys are different (123, 456, 789).
A Query won't work because it can only retrieve items for one partition key at a time.
BatchGetItem is the best choice because it allows retrieving specific items across multiple partition keys in a single API call.

Selected Answer: A

• GetItem: recupera um único item de uma tabela.
• BatchGetItem: retorna até 100 itens de uma ou mais tabelas limitados a 16MB por chamada.

D.
"Query" allows you to use filter - multiple specific items and is less expensive than the Sacan operation.

Selected Answer: A

Need specific Item -> cannot be Scan or Query since they are for retrieving items that match conditions.
We need multiple item then A is the option left.
