EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 33
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A developer is creating an application that includes an Amazon API Gateway REST API in the us-east-2 Region. The developer wants to use Amazon CloudFront and a custom domain name for the API. The developer has acquired an SSL/TLS certificate for the domain from a third-party provider.
How should the developer configure the custom domain for the application?

A. Import the SSL/TLS certificate into AWS Certificate Manager (ACM) in the same Region as the API. Create a DNS A record for the custom domain.

B. Import the SSL/TLS certificate into CloudFront. Create a DNS CNAME record for the custom domain.

C. Import the SSL/TLS certificate into AWS Certificate Manager (ACM) in the same Region as the API. Create a DNS CNAME record for the custom domain.

D. Import the SSL/TLS certificate into AWS Certificate Manager (ACM) in the us-east-1 Region. Create a DNS CNAME record for the custom domain.

Selected Answer: D

To use a certificate in AWS Certificate Manager (ACM) to require HTTPS between viewers and CloudFront, make sure you request (or import) the certificate in the US East (N. Virginia) Region (us-east-1).

Selected Answer: D

I have checked at various places
Answer is D
Reason: ACM just can only import certificate in us-east-1 and we need to associate the imported certificate with us-east-2
The caused confusion regarding it is because of import and associate
Crux: we will import in us-east-1 but use in us-east-2

Selected Answer: D

CloudFront supports certificate only for us-east-1 north Virginia

Selected Answer: D

ACM certificates must reside in us-east-1 for CloudFront, not the same Region as the API (us-east-2 in this case).

Selected Answer: D

D
If you need to use CloudFront, then, you must import it into ue-east-1.

Selected Answer: D
A is not right because for cloudfront you create a CNMA not a DNS A
https://docs.aws.amazon.com/AmazonCloudFront/latest/DeveloperGuide/CNAMEs.html
C is not right because ACM cannot import certificates in us-east-2
https://docs.aws.amazon.com/AmazonCloudFront/latest/DeveloperGuide/cnames-and-https-requirements.html
B is not right. The certificate is for an external CA but can be uploaded to ACM or you must request a public certificate from AWS certificate Manager https://repost.aws/knowledge-center/install-ssl-cloudfront but you cannot import the certificate into CloudFront

Selected Answer: C

C
The first statement of the question: A developer is creating an application that includes an Amazon API Gateway REST API in the us-east-2 Region. ... it is a Regional API, when using a Regional endpoint, the SSL/TLS certificate for the custom domain must be imported into AWS Certificate Manager (ACM) in the same Region as the API, only if we use g Edge-Optimized endpoint, the certificate must be in us-east-1.

Initially I also thought but it is a specific hard core requirement "To use an ACM certificate with CloudFront, make sure you request (or import) the certificate in the US East (N. Virginia) Region (us-east-1)."

Selected Answer: C

To use Amazon CloudFront and a custom domain name for an Amazon API Gateway REST API, the developer should import the SSL/TLS certificate into AWS Certificate Manager (ACM) in the same Region as the API, and create a DNS CNAME record for the custom domain. This is because AWS Certificate Manager can only issue SSL/TLS certificates in the same Region as the API, and a DNS CNAME record maps the custom domain to the CloudFront distribution.

Option A is incorrect because a DNS A record is not sufficient to map the custom domain to the CloudFront distribution.

Option B is incorrect because AWS Certificate Manager must issue the SSL/TLS certificate in the same Region as the API.

Option D is incorrect because the SSL/TLS certificate must be issued in the same Region as the API, and a DNS CNAME record is required to map the custom domain to the CloudFront distribution.

Selected Answer: C

C. Import the SSL/TLS certificate into AWS Certificate Manager (ACM) in the same Region as the API. Create a DNS CNAME record for the custom domain.
Explanation:
Amazon CloudFront can use SSL/TLS certificates stored in AWS Certificate Manager (ACM) to provide secure HTTPS connections for custom domain names. In this scenario, the developer should import the SSL/TLS certificate acquired from a third-party provider into ACM in the same Region as the API (us-east-2 in this case). This allows the certificate to be used by CloudFront.

It's D. It is trying to integrate with CloudFront, therefore it must upload certificates in us-east-1. If it was a regional API, then certificates must be uploaded in the same region of the API Gateway.
