EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 386
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A company uses an AWS Lambda function to transfer files from an Amazon S3 bucket to the company's SFTP server. The Lambda function connects to the SFTP server by using credentials such as username and password. The company uses Lambda environment variables to store these credentials.

A developer needs to implement encrypted username and password credentials.

Which solution will meet these requirements?

A. Remove the user credentials from the Lambda environment. Implement IAM database authentication.

B. Move the user credentials from Lambda environment variables to AWS Systems Manager Parameter Store.

C. Move the user credentials from Lambda environment variables to AWS Key Management Service (AWS KMS).

D. Move the user credentials from the Lambda environment to an encrypted .txt file. Store the file in an S3 bucket.

Selected Answer: B

The best solution is B. Move the user credentials from Lambda environment variables to AWS Systems Manager Parameter Store.

Here's why:

Parameter Store is designed for securely storing sensitive information. It allows you to encrypt parameters (like usernames and passwords) using AWS KMS, offering strong encryption at rest and in transit. Parameter Store also provides fine-grained access control, ensuring only authorized entities can retrieve the credentials.

Selected Answer: B

AWS Key Management Service (KMS) is used for managing encryption keys but is not intended to directly store sensitive data like credentials. You would use KMS for encrypting data, and you would still need a service like Parameter Store to store and retrieve the encrypted credential

Selected Answer: B

We can use two SecureString parameters—one for the SFTP username and one for the SFTP password.

Selected Answer: B

```
import boto3
import os

ssm = boto3.client('ssm')
def lambda_handler(event, context):
username = ssm.get_parameter(Name='SFTPUsername',
WithDecryption=True)['Parameter']['Value']
password = ssm.get_parameter(Name='SFTPPassword',
WithDecryption=True)['Parameter']['Value']
```

Selected Answer: D

D is only answer that clearly encrypts the credentials.

Answer: D
The question explicitly states that the credentials must be encrypted. AWS Systems Manager Parameter does not encrypt the parameters by default, so B does not work as it doesn't state that encryption has been enabled.

Selected Answer: B

parameter store is the most suitable option
