EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 70
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

An engineer created an A/B test of a new feature on an Amazon CloudWatch Evidently project. The engineer configured two variations of the feature (Variation A and Variation B) for the test. The engineer wants to work exclusively with Variation A. The engineer needs to make updates so that Variation A is the only variation that appears when the engineer hits the application's endpoint.

Which solution will meet this requirement?

A. Add an override to the feature. Set the identifier of the override to the engineer's user ID. Set the variation to Variation A.

B. Add an override to the feature. Set the identifier of the override to Variation A. Set the variation to 100%.

C. Add an experiment to the project. Set the identifier of the experiment to Variation B. Set the variation to 0%.

D. Add an experiment to the project. Set the identifier of the experiment to the AWS account's account ISet the variation to Variation A.

Selected Answer: A

Overrides let you pre-define the variation for selected users. to always receive the editable variation.

Selected Answer: A

An override allows you to force specific variations of a feature for a subset of users based on identifiers like user ID. This is useful for testing or debugging without affecting other users or the experiment as a whole.

Selected Answer: A

Quote: To specify that certain users always see a certain variation, choose Overrides, Add override. Then, specify a user by entering their user ID, account ID, or some other identifier in Identifier, and specify which variation they should see.

This can be useful for members of your own testing team or other internal users when you want to make sure they see a specific variation. The sessions of users who are assigned overrides do not contribute to launch or experiment metrics.

Therefore, option A is the best choice to meet the requirement of ensuring the engineer exclusively sees Variation A.

Selected Answer: A

A is the correct answer.

Selected Answer: A

By adding an override to the feature and setting the identifier to the engineer's user ID, the engineer ensures that only their requests are directed to Variation A.
Setting the variation to Variation A explicitly assigns the desired variation to the engineer's requests, effectively ensuring they only experience Variation A.
Therefore, the correct solution is Option A.

Set the variation to 0% or 100% makes no sense. Plus, the identifier should not be an account.

Selected Answer: A

You have to give identifier
