EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 453
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A company is developing a serverless application that requires storage of sensitive API keys as environment variables for various services. The application requires the automatic rotation of the encryption keys every year.

Which solution will meet these requirements with no development effort?

A. Encrypt the environment variables by using AWS Secrets Manager. Set up automatic rotation in Secrets Manager.

B. Encrypt the environment variables by using AWS Key Management Service (AWS KMS) customer managed keys. Enable automatic key rotation.

C. Encrypt the environment variables by using AWS Key Management Service (AWS KMS) AWS managed keys. Configure a custom AWS Lambda function to automate key rotation.

D. Encrypt the environment variables by using AWS Systems Manager Parameter Store. Set up automatic rotation in Parameter Store.

Selected Answer: D

From Gemini

To securely store API keys as environment variables in a serverless application and automatically rotate encryption keys annually, the best solution is to use AWS Systems Manager Parameter Store, especially the Parameter Store feature. This service allows you to store secrets and other sensitive data in a secure, managed environment.

Selected Answer: B

B is correct
WIth custom key in KMS, we can set automatic rotation after 365.
To configure rotation in Secrets Manager we need to provide lambda function. It is costs some develpment effort, right?

Selected Answer: B

B is the correct answer.
A is wrong as Secret Manager is a place to store things, it does not encrypt things.

A. Encrypt the environment variables by using AWS Secrets Manager. Set up automatic rotation in Secrets Manager.

Explanation:
AWS Secrets Manager is designed specifically for securely managing sensitive information like API keys, database credentials, and other secrets. It provides:

Built-in encryption using AWS Key Management Service (KMS).
Automatic rotation of secrets with minimal effort. Secrets Manager has a native feature for automatic rotation that can be enabled for supported use cases.
Integration with AWS services (e.g., Lambda, RDS, etc.).
Key Features Satisfying the Requirements:

The sensitive API keys can be stored securely as secrets.
Automatic rotation can be set up without requiring custom

development. Secrets Manager handles rotation using Lambda functions configured for this purpose.

Selected Answer: B

AWS KMS supports key rotation

upvoted 1 times

YUICH 1 year, 4 months ago

While KMS enables automatic key rotation, it does not manage secrets. The task of securely storing and rotating API keys requires additional development effort, such as creating a Lambda function or a custom solution to integrate with KMS. This contradicts the requirement of "no development effort."

Selected Answer: A

Meets the encryption and key rotation requirement but requires additional development to manage secrets rotation.
A is correct
