## EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 502
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

---

A company generates SSL certificates from a third-party provider. The company imports the certificates into AWS Certificate Manager (ACM) to use with public web applications.

A developer must implement a solution to notify the company's security team 90 days before an imported certificate expires. The company already has configured an Amazon Simple Queue Service (Amazon SQS) queue. The company also has configured an Amazon Simple Notification Service (Amazon SNS) topic that has the security team's email address as a subscriber.

Which solution will provide the security team with the required notification about certificates?

A. Create an Amazon EventBridge rule that specifies the ACM Certificate Approaching Expiration event type. Set the SNS topic as the EventBridge rule's target.

B. Create an AWS Lambda function to search for all certificates that are expiring within 90 days. Program the Lambda function to send each identified certificate's Amazon Resource Name (ARN) in a message to the SQS queue.

C. Create an AWS Step Functions workflow that is invoked by each certificate's expiration notification from AWS CloudTrail. Create an AWS Lambda function to send each certificate's Amazon Resource Name (ARN) in a message to the SQS queue.

D. Configure AWS Config with the acm-certificate-expiration-check managed rule to run every 24 hours. Create an Amazon EventBridge rule that includes an event pattern that specifies the Config Rules Compliance Change detail type and the configured rule. Set the SNS topic as the EventBridge rule's target.

**Selected Answer: D**

Option A does not meet the 90-day requirement.

**Selected Answer: D**

ITs D , the certs are imported , not ACM issued :

EventBridge rule for ACM Certificate Approaching Expiration:

This event type is only for ACM-issued certificates, not imported ones from third-party providers.

**Selected Answer: A**

Manage certificate expiration events

An Amazon EventBridge event will be published when your certificates near expiration. You can configure the "days to expiration" value when these events are first published for your certificates. ACM automatically attempts to renew an ACM generated certificate 60 days prior to certificate expiration. Hence, these events only show up for certificates that have not yet been, or could not be, renewed. Events are published for both issued and imported certificates.

For example, when set to 45, the first event will be published when a certificate is 45 days away from its expiration date, followed by one event per day until expiration.

**Selected Answer: A**

Amazon EventBridge can be used to track specific events, such as the approaching expiration of SSL certificates in AWS Certificate Manager (ACM). AWS publishes events like ACM Certificate Approaching Expiration

to EventBridge, which allows you to trigger specific actions when such events occur.

**Selected Answer: D**

D is the correct answer.

Both options A and D are viable solutions for monitoring certificate expirations. Option A leverages ACM's built-in event for certificates approaching expiration, while Option D uses AWS Config's managed rule acm-certificate-expiration-check to assess certificate compliance and trigger notifications via EventBridge and SNS.

By default, ACM's "Certificate Approaching Expiration" event starts 45 days before expiration. If you require notifications earlier than 45 days, AWS Config's managed rule allows you to specify a custom number of days for the check.
https://docs.aws.amazon.com/acm/latest/APIReference/API_ExpiryEventsConfiguration.html?utm_source=chatgpt.com

Question is asking for 90 days earlier than expiration, so D is the right answer.

**Selected Answer: A**

Amazon EventBridge provides a set of predefined events, and one of these events is related to ACM certificates. Specifically, there is an event type called ACM Certificate Approaching Expiration, which is emitted when an ACM certificate is approaching expiration.
