EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 81
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A company hosts a batch processing application on AWS Elastic Beanstalk with instances that run the most recent version of Amazon Linux. The application sorts and processes large datasets.

In recent weeks, the application's performance has decreased significantly during a peak period for traffic. A developer suspects that the application issues are related to the memory usage. The developer checks the Elastic Beanstalk console and notices that memory usage is not being tracked.

How should the developer gather more information about the application performance issues?

A. Configure the Amazon CloudWatch agent to push logs to Amazon CloudWatch Logs by using port 443.

B. Configure the Elastic Beanstalk .ebextensions directory to track the memory usage of the instances.

C. Configure the Amazon CloudWatch agent to track the memory usage of the instances.

D. Configure an Amazon CloudWatch dashboard to track the memory usage of the instances.

Using elastic beanstalk .ebextensions dir

upvoted 1 times

eboehm Highly Voted 2 years, 9 months ago

Selected Answer: B

for elastic beanstalk you make this configuration in the .ebtextensions folder

But the question says Linux

upvoted 3 times

Naj_64 2 years, 8 months ago

Applies to Linux as well:

ebextensions is deprecated for linux newest version which is mentioned in the question

sumanshu Most Recent 1 year, 3 months ago

Selected Answer: C

A) Eliminated - Logs provide insights into application behavior but won't help in monitoring resource usage such as memory.

B) Eliminated - The .ebextensions directory is used for customizing Elastic Beanstalk environments, such as installing software or modifying instance configurations.

C) Correct - The Amazon CloudWatch agent can collect system-level metrics like memory usage, which is not tracked by default in CloudWatch for EC2 instances

D) Eliminated - A CloudWatch dashboard is used to visualize metrics that are already being tracked.

Selected Answer: C

.ebextensions is for customizing your Elastic Beanstalk environment. While you can use it to install monitoring tools, directly configuring it to track memory isn't the standard or most efficient approach. So Answer is 'C'

SathyaJS 2 years ago

Answer is : C
from Gemini here is why B is incorrect
B. .ebextensions directory: While .ebextensions can be used for configuration within Elastic Beanstalk, it's not designed to track memory usage directly.

Selected Answer: C

This option allows the developer to gather detailed performance metrics, including memory usage, from the EC2 instances. By configuring the CloudWatch agent, the developer can monitor the memory usage in real-time and analyze historical data to identify trends or patterns that may be affecting the application's performance. This approach provides actionable insights with minimal overhead and without the need for custom logging or external tools.

SerialiDr 2 years, 2 months ago

Selected Answer: C

This is the most direct and appropriate solution. By installing and configuring the Amazon CloudWatch agent on the Elastic Beanstalk instances, the developer can collect detailed system-level metrics, such as memory usage, and send them to CloudWatch for monitoring and analysis.

Chimzi 2 years, 2 months ago

Selected Answer: C

The .ebextensions directory is used for customizing the environment (installing packages, running scripts...) it can't track memory usage alone.

Selected Answer: C

We configure the agent not the directory itself.

upvoted 1 times

a_win 2 years, 3 months ago

Selected Answer: C

The Amazon CloudWatch agent can be configured to collect various metrics, including memory usage, from the instances. By setting up the CloudWatch agent to monitor memory metrics, the developer can get insights into the memory usage patterns during peak traffic periods. This data can help diagnose if memory constraints are causing the performance degradation.

TallManDan 2 years, 4 months ago

It requires both B and C. I'm guessing the question is supposed to say "Select Two".

Selected Answer: B

I m confused between B & C ,as for beanstalk we need to configure Amazon CloudWatch agent to track the memory usage of the instances in the .ebtextensions folder .

Nagasoracle 2 years, 5 months ago

Selected Answer: B

I vote for B, since it is already available with .ebextensions and not required agent
