answer- d
AWS CodeDeploy can automate the deployment of code to any instance, including Amazon EC2 instances and on-premises servers. However, it does not provide the same level of automation as Elastic Beanstalk, and it requires more manual intervention from developers.
AWS CloudFormation can help you model and set up your AWS resources. However, it does not provide any automation for deploying or managing applications.
AWS OpsWorks is a configuration management service that provides managed instances of Chef and Puppet. However, it is not as easy to use as Elastic Beanstalk, and it does not provide the same level of automation for deploying or managing applications.

Selected Answer: D

AWS Elastic Beanstalk is designed for developers like the one in your scenario who want to deploy and manage applications without worrying about the underlying infrastructure. It automates the deployment process and automatically handles capacity provisioning, load balancing, auto-scaling, and application health monitoring. You can use it with various platforms including Ruby.
