EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 86
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A developer is implementing an AWS Cloud Development Kit (AWS CDK) serverless application. The developer will provision several AWS Lambda functions and Amazon API Gateway APIs during AWS CloudFormation stack creation. The developer's workstation has the AWS Serverless Application Model (AWS SAM) and the AWS CDK installed locally.

How can the developer test a specific Lambda function locally?

A. Run the sam package and sam deploy commands. Create a Lambda test event from the AWS Management Console. Test the Lambda function.

B. Run the cdk synth and cdk deploy commands. Create a Lambda test event from the AWS Management Console. Test the Lambda function.

C. Run the cdk synth and sam local invoke commands with the function construct identifier and the path to the synthesized CloudFormation template.

D. Run the cdk synth and sam local start-lambda commands with the function construct identifier and the path to the synthesized CloudFormation template.

Selected Answer: C

The developer can test a specific Lambda function locally by running the cdk synth command to synthesize the AWS CDK application into an AWS CloudFormation template. Then, the developer can use the sam local invoke command with the function construct identifier and the path to the synthesized CloudFormation template to test the Lambda function locally (option C).

Selected Answer: C

o test a specific Lambda function locally when using the AWS Cloud Development Kit (AWS CDK), the developer can use the AWS Serverless Application Model (AWS SAM) CLI's local testing capabilities in conjunction with the CDK. The typical process would be:

Run cdk synth to synthesize the AWS CDK app into a CloudFormation template.
Use sam local invoke to run the specific Lambda function locally, providing the function's logical identifier and the path to the synthesized CloudFormation template as arguments.

Selected Answer: C

A) Eliminated - The sam package and sam deploy commands are used to upload the Lambda function code and deploy it to AWS.

B) Eliminated - The cdk deploy command deploys the stack to AWS.

C) Correct - The sam local invoke command uses this template to run the Lambda function locally, simulating the AWS Lambda execution environment.

D) Eliminated

Selected Answer: C

Note that the sam local start-lambda subcommand starts a local endpoint to emulate AWS Lambda.
