Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 87
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A company's new mobile app uses Amazon API Gateway. As the development team completes a new release of its APIs, a developer must safely and transparently roll out the API change.

What is the SIMPLEST solution for the developer to use for rolling out the new API version to a limited number of users through API Gateway?

A. Create a new API in API Gateway. Direct a portion of the traffic to the new API using an Amazon Route 53 weighted routing policy.

B. Validate the new API version and promote it to production during the window of lowest expected utilization.

C. Implement an Amazon CloudWatch alarm to trigger a rollback if the observed HTTP 500 status code rate exceeds a predetermined threshold.

D. Use the canary release deployment option in API Gateway. Direct a percentage of the API traffic using the canarySettings setting.

Selected Answer: D

A) Eliminated - creating a new API in API Gateway requires managing two separate APIs, which adds unnecessary complexity.

B) Eliminated - This is a direct cutover approach, not a gradual rollout to a limited number of users. If issues arise, all users are impacted, which is not safe or transparent.

C) Eliminated - It is not relevant to the question's requirement

D) Correct - It allows gradual exposure of the new API version to a subset of users, minimizing risk.

Selected Answer: D

Canary deployments allow you to divert a percentage of your API traffic to a new API version, enabling you to test how the new version will perform under real-world conditions without fully replacing the previous version. This is especially useful for reducing the risk associated with deploying new versions.
