EXAM AWS CERTIFIED AI PRACTITIONER AIF-C01 TOPIC 1 QUESTION 2 DISC...

Exam question from Amazon's AWS Certified AI Practitioner AIF-C01

Question #: 2

Topic #: 1

[All AWS Certified AI Practitioner AIF-C01 Questions]

A law firm wants to build an AI application by using large language models (LLMs). The application will read legal documents and extract key points from the documents.

Which solution meets these requirements?

A. Build an automatic named entity recognition system.

B. Create a recommendation engine.

C. Develop a summarization chatbot.

D. Develop a multi-language translation system.

Selected Answer: C

The law firm wants to extract key points from legal documents, which aligns with the goal of summarization. A summarization chatbot

powered by large language models (LLMs) can read through legal documents and provide concise, accurate summaries that capture the essential points, making it the most appropriate choice.

Selected Answer: C

Summarization chatbots use LLMs to understand legal documents and extract their key points,
whereas NER only identifies specific entities like names and dates from the legal document

Selected Answer: C

It is NOT A because while NER is useful for finding specific facts (like "who are the parties" or "what is the date of execution"), it cannot extract complex key points such as "The agreement is automatically renewed unless terminated with 90 days' notice." The latter requires semantic understanding and summarization, not just entity classification. "C" uses LLMs which can summarize context well and the chatbot interface provides a simple, easy user experience for retrieving said summaries.

Selected Answer: A

Reading a document and extracting key points means Named entity Recognition.
The description of the task may seem similar to summarization, but we are not talking about chatbots, so it doesn't apply to this case.

kenyanpaul 8 months ago

Selected Answer: C

While useful for identifying specific entities like names, dates, locations, NER doesn't provide comprehensive key point extraction and is too narrow in scope for the stated requirement

Selected Answer: C

C is the correct answer.

upvoted 1 times

Nagen_007 10 months, 2 weeks ago

Selected Answer: C

Answer "c" is correct. The solution should include the core components to build an AI application that reads legal documents and extracts key points using large language models (LLMs).

Selected Answer: C

Extracting legal language and key points is an example of an extract summary

upvoted 1 times

Gokul_krish3 1 year, 2 months ago

Selected Answer: C

"C" is correct - The primary requirement is to read legal documents and extract key points.
Summarization is the best approach for condensing lengthy legal text into key points while preserving important details.

"A" is incorrect - NER helps identify names, dates, contract numbers. but does not summarize key points from documents.

Selected Answer: C

AWS certification exams are introducing new question types, including ordering, matching, and case study questions, alongside traditional multiple choice and multiple response formats. The ordering type requires arranging selected responses in the correct sequence, while matching questions involve linking statements to prompts. Case studies recycle a scenario across multiple questions, allowing candidates to save time by understanding the context once. Each question is evaluated independently, meaning it's crucial to answer all parts correctly to receive credit.

Selected Answer: A

NER should be more suitable for the legal documents. It is recommended by the Amazon Comprehend docs. When you try to ask

an AI Assistant without giving them answers, it will also prefer NER with its advantageous.
