EXAM AWS CERTIFIED AI PRACTITIONER AIF-C01 TOPIC 1 QUESTION 4 DISC...

Exam question from Amazon's AWS Certified AI Practitioner AIF-C01

Question #: 4

Topic #: 1

[All AWS Certified AI Practitioner AIF-C01 Questions]

A company has built an image classification model to predict plant diseases from photos of plant leaves. The company wants to evaluate how many images the model classified correctly.

Which evaluation metric should the company use to measure the model's performance?

A. R-squared score

B. Accuracy

C. Root mean squared error (RMSE)

D. Learning rate

Accuracy is the most straightforward metric, measuring the proportion of correctly predicted instances out of the total instances. It is suitable

when the classes are balanced (but can be misleading for imbalanced datasets).

Selected Answer: B

Accuracy= Total predictions / Number of correct predictions

If you see how many were correctly classified then it is Accuracy (binary & multiclass)
If you see regression values then it is R^2 or RMSE (predicting continuous values)
No metric called Learning rate

Classification metrics
These apply when theproblem is classification (e.g., predicting illness vs healthy, disease types, etc.):
Accuracy , AUC, BalancedAccuracy ,F1 score ,F1macro ,Precision , PrecisionMacro ,Recall ,RecallMacro —,LogLoss —

Regression metrics
For regression tasks (predicting continuous values):
MAE — mean absolute error , MSE — mean squared error.

Other metrics
InferenceLatency (useful for performance diagnostics).

Selected Answer: B

Accuracy is a common metric for evaluating image classification , when the accuracy is high, it generally means the model is performing well by making a higher proportion of correct predictions.

Selected Answer: B

A métrica de avaliação mais apropriada para medir quantas imagens o modelo classificou corretamente em um modelo de classificação é:

B. Exatidão

Explicações das opções:
A. Pontuação R-quadrado: usada em modelos de regressão, não em classificação.

B. Exatidão (Accuracy): mede a proporção de previsões corretas em relação ao total de previsões — ideal para classificação.

C. RMSE (Raiz do Erro Quadrático Médio): também usada em regressão, não em problemas de classificação.

D. Taxa de aprendizado: não é uma métrica de avaliação, mas um hiperparâmetro usado durante o treinamento do modelo.

Resposta correta: B. Exatidão

Selected Answer: B

A exatidão (accuracy) é uma métrica apropriada para avaliar o desempenho de um modelo de classificação de imagens. Ela calcula a proporção de imagens que o modelo classificou corretamente em relação ao total de imagens avaliadas.

Selected Answer: B

ccuracy is a straightforward metric that measures the percentage of correct predictions made by the model out of all predictions. Since the goal is to evaluate how many images the model classified correctly (i.e., how many plant diseases were identified correctly from photos), accuracy is the best choice for this classification task.

Selected Answer: B

B. Accuracy: This metric measures the proportion of correctly classified instances out of the total number of instances. It directly addresses the question of "how many images the model classified correctly."
