EXAM AWS CERTIFIED AI PRACTITIONER AIF-C01 TOPIC 1 QUESTION 15 DIS...

Exam question from Amazon's AWS Certified AI Practitioner AIF-C01

Question #: 15

Topic #: 1

[All AWS Certified AI Practitioner AIF-C01 Questions]

Which metric measures the runtime efficiency of operating AI models?

A. Customer satisfaction score (CSAT)

B. Training time for each epoch

C. Average response time

D. Number of training instances

Selected Answer: C

Average response time refers to the time taken by an AI model to produce a result after receiving an input. It is a critical metric for assessing the runtime efficiency of an AI model during inference, particularly in applications where quick responses are essential, such as in real-time applications or interactive systems.

Selected Answer: C

O tempo médio de resposta mede a eficiência do tempo de execução de um modelo operacional de IA — ou seja, quanto tempo ele leva para processar uma solicitação e Retornar uma resposta. Isso é crucial em ambientes de produção onde a latência pode impactar a experiência do usuário e a performance do sistema. As outras opções não medem diretamente a eficiência operacional em tempo de execução: A. CSAT (Customer Satisfaction Score) avalia a satisfação do cliente, não o desempenho técnico do modelo.

B. Tempo de treinamento por época mede a eficiência durante o treinamento, e não durante a execução operacional. D. Número de instâncias de treinamento refere-se à infraestrutura usada, mas não mede eficiência diretamente.

Selected Answer: C

Average response time measures how quickly the AI model can generate a result after receiving input. This is a key metric for runtime efficiency, as it directly reflects how fast the model operates during inference or real-time usage. Lower response times indicate higher runtime efficiency.

Selected Answer: C

C: Average response time

Explanation:
Average response time is a key metric for measuring the runtime efficiency of operating AI models. It indicates how quickly the AI model processes a request and returns a response, which is critical for assessing the performance and efficiency of deployed models, especially in real-time applications.

Selected Answer: C

Average response time measures how quickly an AI model produces predictions or outputs during runtime, making it a key metric for evaluating the runtime efficiency of AI models.

It reflects the latency users experience when interacting with the model, which is especially critical for applications like chatbots, recommendation systems, or fraud detection.

Selected Answer: C

Yes, "average response time" is the primary metric used to measure the runtime efficiency of operating AI models, as it directly reflects how quickly a model can produce a prediction or response to a given input
