EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 124
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

An organization is storing large files in Amazon S3, and is writing a web application to display meta-data about the files to end-users. Based on the metadata a user selects an object to download. The organization needs a mechanism to index the files and provide single-digit millisecond latency retrieval for the metadata.

What AWS service should be used to accomplish this?

A. Amazon DynamoDB

B. Amazon EC2

C. AWS Lambda

D. Amazon RDS

Selected Answer: A

In this scenario, the metadata about the files can be stored in a DynamoDB table with a primary key based on the metadata attributes. This would enable the organization to quickly query and retrieve metadata about the files in real-time, with single-digit millisecond latency.

Selected Answer: A

DynamoDB is a fully managed NoSQL database service that provides single-digit millisecond latency for read and write operations.

D) Eliminated - While RDS can store metadata and index it using relational queries, it does not guarantee single-digit millisecond latency like DynamoDB.

Selected Answer: A

A. Amazon DynamoDB: DynamoDB is a fast and flexible NoSQL database service that provides consistent single-digit millisecond latency for data retrieval. It is well-suited for applications that require high-performance data retrieval. The metadata of the files stored in S3 can be indexed and stored in a DynamoDB table, enabling efficient and quick access for the web application. This setup allows users to quickly browse metadata and select files for download.

Selected Answer: A

Amazon DynamoDB is a highly scalable and fully managed NoSQL database service that can provide fast and consistent performance at any scale. It is a suitable choice for indexing and storing metadata associated with files.
