EXAM AWS CERTIFIED AI PRACTITIONER AIF-C01 TOPIC 1 QUESTION 21 DIS...

Exam question from Amazon's AWS Certified AI Practitioner AIF-C01

Question #: 21

Topic #: 1

[All AWS Certified AI Practitioner AIF-C01 Questions]

Which feature of Amazon OpenSearch Service gives companies the ability to build vector database applications?

A. Integration with Amazon S3 for object storage

B. Support for geospatial indexing and queries

C. Scalable index management and nearest neighbor search capability

D. Ability to perform real-time analysis on streaming data

Selected Answer: C

Scalable index management and nearest neighbor search capability: Amazon OpenSearch Service provides built-in support for vector search, which allows for efficient nearest neighbor search (such as k-nearest

neighbors or k-NN) in large datasets. This is essential for vector databases, which store high-dimensional data (such as embeddings from machine learning models) and support fast similarity search. The scalable index management ensures that these searches can be performed efficiently even with large datasets.

Selected Answer: C

Scalable index management and k-NN algorithms which support to build and handle the recommendation systems, semantic search and anomalies detection.

Selected Answer: C

C: Scalable index management and nearest neighbor search capability

Explanation:
The Amazon OpenSearch Service supports building vector database applications by enabling nearest neighbor search capability. This feature allows the service to efficiently perform similarity searches, which is crucial for applications that rely on vector embeddings (e.g., recommendation systems, image or text similarity searches). Combined with scalable index management, this makes OpenSearch an excellent choice for vector database applications.

Selected Answer: C

Amazon OpenSearch Service provides scalable index management and supports nearest neighbor (k-NN) search, which is essential for building vector database applications.
Vector databases store embeddings (numerical representations of data) and use k-NN search to retrieve similar data points based on proximity in the vector space, which is a foundational feature for applications such as recommendation systems, semantic search, and anomaly detection.
These capabilities make OpenSearch ideal for developing vector-based applications.

c- The key feature of Amazon OpenSearch Service that enables companies to build vector database applications is its k-NN (k-nearest neighbors) functionality, specifically provided through the k-NN plugin. This allows OpenSearch Service to act as a vector database with efficient vector similarity search capabilities.
