EXAM AWS CERTIFIED AI PRACTITIONER AIF-C01 TOPIC 1 QUESTION 22 DIS...

Exam question from Amazon's AWS Certified AI Practitioner AIF-C01

Question #: 22

Topic #: 1

[All AWS Certified AI Practitioner AIF-C01 Questions]

Which option is a use case for generative AI models?

A. Improving network security by using intrusion detection systems

B. Creating photorealistic images from text descriptions for digital marketing

C. Enhancing database performance by using optimized indexing

D. Analyzing financial data to forecast stock market trends

Selected Answer: B

B is the correct answer.

Selected Answer: B

Generative AI models are designed to generate new content based on input data.

A common use case is generating photorealistic images from text descriptions, often used in digital marketing, content creation, and design.

Models like DALL·E, Stable Diffusion, or MidJourney can create high-quality images based on user prompts.

Selected Answer: B

Creating photorealistic images from text descriptions for digital marketing: Generative AI models, such as generative adversarial networks (GANs) and diffusion models, are capable of generating new content (like images, text, and audio) based on input data. In this case, a generative model can create photorealistic images from text descriptions, which is widely used in digital marketing and content creation.

Selected Answer: B

Generative AI is used to generate new content, images, video, and audio from existing content or new inputs from various data sources.

Moon 1 year, 3 months ago

Selected Answer: B

The correct answer is B. Creating photorealistic images from text descriptions for digital marketing.

Generative AI models are designed to create new content, such as text, images, audio, or code. Creating images from text descriptions is a prime example of this capability.

Here's why the other options are not primarily use cases for generative AI:

A. Improving network security by using intrusion detection systems: While AI can be used for intrusion detection, this is more of a discriminative or predictive task (classifying network traffic as malicious or benign), not generating new content.
C. Enhancing database performance by using optimized indexing: This is related to database management and optimization, not content generation.
D. Analyzing financial data to forecast stock market trends: This involves

statistical analysis and prediction based on existing data, again a predictive task, not generating new content.

Selected Answer: D

Why not D ?
Because we can also fine tune model using historic data to predict market trends using gen AI.

Selected Answer: B

The correct answer is: B. Creating photorealistic images from text descriptions for digital marketing
Here's a detailed explanation:
Understanding Generative AI's Capabilities
Generative AI models, like DALL-E, Midjourney, and Stable Diffusion, are specifically designed to create new content based on text prompts. In this case, generating images from textual descriptions is a quintessential use case.
