EXAM AWS CERTIFIED AI PRACTITIONER AIF-C01 TOPIC 1 QUESTION 23 DIS...

Exam question from Amazon's AWS Certified AI Practitioner AIF-C01

Question #: 23

Topic #: 1

[All AWS Certified AI Practitioner AIF-C01 Questions]

A company wants to build a generative AI application by using Amazon Bedrock and needs to choose a foundation model (FM). The company wants to know how much information can fit into one prompt. Which consideration will inform the company's decision?

A. Temperature

B. Context window

C. Batch size

D. Model size

Selected Answer: B

A company needs to know the maximum input size for a single prompt when choosing a Foundation Model (FM) in Amazon Bedrock.

A. Temperature: This controls the randomness of the output, not the input prompt length. Temperature affects creativity, not input size.
B. Context window: This defines the maximum length of the input prompt the model can process. It directly limits how much information can be included.
C. Batch size: This is the number of prompts processed at once, affecting throughput, not individual prompt length. It's about processing multiple prompts efficiently.
D. Model size: This relates to the model's overall capacity and complexity, not directly to the input prompt length. Size impacts performance, not input limits.
Therefore, B. Context window is the correct answer.

Selected Answer: B

A resposta correta é **B. Janela de contexto**.
A janela de contexto determina quantos tokens (palavras ou partes de palavras) o modelo pode processar de uma vez. Quanto maior a janela de contexto, mais informações podem ser inseridas no prompt para influenciar a resposta gerada. Isso é essencial para prompts longos ou que exigem mais detalhes e contexto.
Os outros fatores também são importantes, mas influenciam outros aspectos do modelo: **Temperatura** afeta a aleatoriedade das respostas, tornando-as mais criativas ou previsíveis.
- **Tamanho do lote** impacta a eficiência durante o treinamento ou inferência em múltiplas solicitações. Tamanho do modelo** pode afetar a capacidade de resposta e consumo de recursos, mas não define diretamente a quantidade de informações no prompt.

Selected Answer: B

Context window: The context window refers to the amount of text (or tokens) that a model can process at once. This is crucial when working with foundation models (FMs) like those available in Amazon Bedrock, as it defines the maximum input size for the prompt. The context window determines how much of the prompt the model can "remember" and use to generate responses. If the prompt exceeds the context window, the model will only process the portion of the prompt that fits within this limit, potentially missing important details.

Selected Answer: B

The context-window is the input prompt for the model generation.

Selected Answer: B

The correct answer is:

B. Context window
Explanation:

The context window of a foundation model (FM) determines how much information can fit into one prompt. It refers to the maximum number of tokens (words, characters, or subwords) that the model can process in a single input prompt, including the input and the output combined.

The context window size varies across different foundation models, and understanding this parameter is critical for applications like document summarization or question-answering systems where long inputs need to be processed.

Selected Answer: B

B. Context window

The context window of a foundation model determines the maximum amount of text that can be processed in a single prompt. A larger context window allows for more complex and informative prompts, while a smaller context window limits the amount of information that can be provided.

The other options are not directly related to the maximum prompt length:

Temperature: This parameter controls the randomness of the model's output.
Batch size: This refers to the number of samples processed in a single batch during training or inference.
Model size: This refers to the number of parameters in the model, which affects its complexity and performance.
Therefore, when choosing a foundation model for a generative AI application, the company should carefully consider the context window to ensure that it can accommodate the desired input length.

Selected Answer: B

The context window refers to the maximum number of tokens (words or pieces of words) that a foundation model can process in a single input prompt.
