## EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 134
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

---

A company is developing a serverless application that consists of various AWS Lambda functions behind Amazon API Gateway APIs. A developer needs to automate the deployment of Lambda function code. The developer will deploy updated Lambda functions with AWS CodeDeploy. The deployment must minimize the exposure of potential errors to end users. When the application is in production, the application cannot experience downtime outside the specified maintenance window.

Which deployment configuration will meet these requirements with the LEAST deployment time?

A. Use the AWS CodeDeploy in-place deployment configuration for the Lambda functions. Shift all traffic immediately after deployment.

B. Use the AWS CodeDeploy linear deployment configuration to shift 10% of the traffic every minute.

C. Use the AWS CodeDeploy all-at-once deployment configuration to shift all traffic to the updated versions immediately.

D. Use the AWS CodeDeploy predefined canary deployment configuration to shift 10% of the traffic immediately and shift the remaining traffic after 5 minutes.

Selected answer is A.
To them who have choosen D, you have forgotton also about "When the application is in production, the application cannot experience downtime outside the specified maintenance window."

Selected Answer: D

D. Use the AWS CodeDeploy predefined canary deployment configuration to shift 10% of the traffic immediately and shift the remaining traffic after 5 minutes: The canary deployment strategy first shifts a small percentage of traffic to the new version (e.g., 10%) and, after a specified period (e.g., 5 minutes), shifts the remaining traffic. This approach allows for initial validation of the new version with minimal user exposure before full rollout, balancing speed and risk mitigation.

Selected Answer: D

Lambda deploy supports just Linear or Canary. So answer is D. Linear or All

**Yuxing_Li** 2 years, 1 month ago

Selected Answer: D

Canary is faster than linear in this case.

upvoted 2 times

**love777** 2 years, 1 month ago

Selected Answer: A

Explanation:

In an AWS Lambda context, using the in-place deployment configuration minimizes deployment time and provides fast updates to the function's code. In this case, the application consists of AWS Lambda functions behind Amazon API Gateway APIs. With the in-place deployment configuration, all traffic is shifted to the updated versions of the Lambda functions immediately after deployment.

Option B suggests a linear deployment configuration that shifts 10% of the traffic every minute. While this provides controlled deployment and gradual rollout, it might not be the fastest approach if you want to minimize deployment time.

Option C suggests an all-at-once deployment configuration. While this configuration might be fast, it poses a higher risk of exposing potential errors to end users all at once.

**RaidenKurosaki** 2 years, 1 month ago

Selected Answer: D

Canary deployment

upvoted 2 times

**Parsons** 2 years, 1 month ago

Selected Answer: D

D is correct.
Keyword:
-"must minimize the exposure of potential errors to end users", you just have to trade-off 10% of traffic
- "cannot experience downtime ", eliminate C.
- "LEAST deployment time", with B, You have to take 10 mins other than D just 5 min.

Selected Answer: D

the predefined canary deployment configuration, which shifts a small percentage of traffic to the updated versions immediately, and then shifts the remaining traffic after a specified period
