EXAM AWS CERTIFIED AI PRACTITIONER AIF-C01 TOPIC 1 QUESTION 50 DIS...

Exam question from Amazon's AWS Certified AI Practitioner AIF-C01

Question #: 50

Topic #: 1

[All AWS Certified AI Practitioner AIF-C01 Questions]

A company is using an Amazon Bedrock base model to summarize documents for an internal use case. The company trained a custom model to improve the summarization quality.

Which action must the company take to use the custom model through Amazon Bedrock?

A. Purchase Provisioned Throughput for the custom model.

B. Deploy the custom model in an Amazon SageMaker endpoint for real-time inference.

C. Register the model with the Amazon SageMaker Model Registry.

D. Grant access to the custom model in Amazon Bedrock.

Selected Answer: A

Initially I was going with D but after reading this article sticking with A
https://docs.aws.amazon.com/bedrock/latest/userguide/model-

customization-use.html?form=MG0AV3

Apparently you didn't bother reading the whole guide since it gives you two options for deploying custom models, the second choice is on demand. So it is D

The article you've quoted says provisioned throughput is NOT required for Nova models. Answer is D

Selected Answer: A

A To customize model you must purchase Provisioned Throughput.

No you do not, read the guide, you can deploy custom models both ways

AWSCer1937 Most Recent 1 week, 2 days ago

Selected Answer: D

A should be optional
Bedrock manages models and access centrally.
Even if you've trained or customized a model, you must enable access to it in Bedrock before you can invoke it for tasks like summarization.

Selected Answer: D

When you customize a base model in Amazon Bedrock, the model already exists within Bedrock. To invoke and use that custom model for inference, you must grant access to it in Amazon Bedrock (via the console or API).

Selected Answer: D

Explanation:

When a company fine-tunes or customizes a model and wants to use it through Amazon Bedrock, the model must be explicitly granted access in Amazon Bedrock before it can be invoked by applications.

This step enables:

Use of the custom model through Bedrock APIs

Proper access control via IAM roles and permissions

Why the other options are incorrect:

A. Purchase Provisioned Throughput for the custom model ❌

Provisioned Throughput is optional and used for predictable latency or higher capacity, not for enabling access.

Selected Answer: B

To use a custom-trained model with Amazon Bedrock for tasks like summarization, the company must Deploy the custom model to an Amazon SageMaker endpoint, making it available for real-time inference, and then grant Amazon Bedrock access to that endpoint, allowing Bedrock to invoke it as a custom model for processing.

Selected Answer: D

When using Amazon Bedrock, even after a company trains or customizes a model (for example, via fine-tuning), the model cannot be used by applications until access is explicitly granted in Amazon Bedrock.

Model access control is a required step to:

Enable usage of the custom or fine-tuned model

Control which AWS accounts, IAM roles, or users can invoke the model through Bedrock APIs

Selected Answer: D

Amazon Bedrock allows users to access various foundation models for different tasks (e.g., summarization, text generation, etc.). If the company has trained a custom model (using either their own data or a modified base model), they need to ensure it is registered and accessible within Amazon Bedrock.

By granting access to the custom model, the company can make it available for use via the Amazon Bedrock platform.
urchase Provisioned Throughput for the custom model: This is not necessary for Bedrock as the service automatically manages throughput based on demand, and provisioning is generally associated with services like Amazon SageMaker when deploying models.

Selected Answer: A

I think that this question is before the on-demand reference was announces (Jul 2025)
https://aws.amazon.com/blogs/machine-learning/implementing-on-demand-deployment-with-customized-amazon-nova-models-on-amazon-bedrock/

But in any case IAM is irrelevant so D is out of the equation.

Selected Answer: D

It is D, read the guide, you do not need to buy provisioned throughput, the guide says for custom models you can use either provisioned or on demand

Selected Answer: D

Key words in this question: "To Use" You can not use it with out permissions. If the key words were "to run" it would be Provision-A. So the answer is D. We were all network admins at one point in time, permissions are always first. Its customer. IE not already in bedrock, so you need access first.

Selected Answer: D

question is about using the custom model not training. so it has to be D

upvoted 2 times

Rcosmos 10 months, 3 weeks ago

Selected Answer: D

A melhor opção seria D. Conceda acesso ao modelo personalizado no Amazon Bedrock.

O Amazon Bedrock permite que empresas utilizem modelos básicos e personalizem modelos para casos de uso específicos. Para que a empresa possa usar o modelo treinado, ela deve garantir que o modelo personalizado esteja acessível dentro do Bedrock. Dessa forma, ele pode ser utilizado para inferências e integração com aplicações.
