EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 153
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A company uses a custom root certificate authority certificate chain (Root CA Cert) that is 10 KB in size to generate SSL certificates for its on-premises HTTPS endpoints. One of the company's cloud-based applications has hundreds of AWS Lambda functions that pull data from these endpoints. A developer updated the trust store of the Lambda execution environment to use the Root CA Cert when the Lambda execution environment is initialized. The developer bundled the Root CA Cert as a text file in the Lambda deployment bundle.

After 3 months of development, the Root CA Cert is no longer valid and must be updated. The developer needs a more efficient solution to update the Root CA Cert for all deployed Lambda functions. The solution must not include rebuilding or updating all Lambda functions that use the Root CA Cert. The solution must also work for all development, testing, and production environments. Each environment is managed in a separate AWS account.

Which combination of steps should the developer take to meet these requirements MOST cost-effectively? (Choose two.)

A. Store the Root CA Cert as a secret in AWS Secrets Manager. Create a resource-based policy. Add IAM users to allow access to the secret.

B. Store the Root CA Cert as a SecureString parameter in AWS Systems Manager Parameter Store. Create a resource-based policy. Add IAM users to allow access to the policy.

C. Store the Root CA Cert in an Amazon S3 bucket. Create a resource-based policy to allow access to the bucket.

D. Refactor the Lambda code to load the Root CA Cert from the Root CA Cert's location. Modify the runtime trust store inside the Lambda function handler.

E. Refactor the Lambda code to load the Root CA Cert from the Root CA Cert's location. Modify the runtime trust store outside the Lambda function handler.

Selected Answer: AE

The max size of storage in Secrets Manager is 10kb. For SSM Parameter store, it's 8Kb.

Correct options are A and E.

not_a_bot_definitely 2 years, 4 months ago

Secrets Manager is not cost-effective compared to option C - S3 bucket.
Question clearly asks "MOST cost-effective"

https://www.examtopics.com/discussions/amazon/view/96242-exam-aws-certified-developer-associate-topic-1-question-429/

So answer is CE

Selected Answer: CE

The cert is 10kb and not a secret so s3 is the cheapest and also for E one time change and future cert change are just s3 update

Selected Answer: AE

In AWS, a Root CA certificate (Public CA) can be stored using either AWS Secrets Manager or AWS Certificate Manager (ACM). Secrets Manager is a secure way to store sensitive data like certificates and API keys, while ACM helps manage public and private certificates for use within AWS.

Selected Answer: AE

beyond cost effective. AWS always recommend the secured way. in that case, it will be A and E

In both A and B why does it say IAM user? should it not be IAM role? IAM role for Lambda to access them?

upvoted 1 times

AlmeroSenior 10 months, 2 weeks ago

States on premises , and not mention IAM anywhere . So guessing that's why its USER , not Role .

Selected Answer: BE

This solution will meet the requirements by storing the Root CA Cert as a Secure String parameter in AWS Systems Manager Parameter Store, which is a secure and scalable service for storing and managing configuration data and secrets. The resource-based policy will allow IAM users in different AWS accounts and environments to access the parameter without requiring cross-account roles or permissions. The Lambda code will be refactored to load the Root CA Cert from the parameter store and modify the runtime trust store outside the Lambda function handler, which will improve performance and reduce latency by avoiding repeated calls to Parameter Store and trust store modifications for each invocation of the Lambda function.

Selected Answer: CE

Cost effective, use S3 instead of Secrets Manager.

Selected Answer: AE

After going through the links :
A : https://aws.amazon.com/blogs/security/use-aws-secrets-manager-to-simplify-the-management-of-private-certificates/
E : https://docs.aws.amazon.com/acm/latest/userguide/renew-private-cert.html

Selected Answer: CE

C.E.
Secrets Manager is the most expensive amongst all options. S3 seems more cost-effective.

B. is incorrect, because at the end it states about accessing to the policy, not to the parameter itself.

Selected Answer: BE

Also AE works, but BE is more cost effective.

Pay attention on this part "Add IAM users to allow access to the policy." It should give an access to the parameter, not to the policy.

upvoted 3 times

CalvinL4 2 years, 3 months ago

CE should be the answer. The string size is over 4/8 kb which the parameter store allows. So, the parameter store is out. Comparing the price, s3 is much cheaper than secrets manager.

I can't see why using AWS Secrets Manager can be cost-effective, so I'm voting for C
