EXAM AWS CERTIFIED AI PRACTITIONER AIF-C01 TOPIC 1 QUESTION 71 DIS...

Exam question from Amazon's AWS Certified AI Practitioner AIF-C01

Question #: 71

Topic #: 1

[All AWS Certified AI Practitioner AIF-C01 Questions]

An accounting firm wants to implement a large language model (LLM) to automate document processing. The firm must proceed responsibly to avoid potential harms.

What should the firm do when developing and deploying the LLM? (Choose two.)

A. Include fairness metrics for model evaluation.

B. Adjust the temperature parameter of the model.

C. Modify the training data to mitigate bias.

D. Avoid overfitting on the training data.

E. Apply prompt engineering techniques.

Selected Answer: AC

A. Include fairness metrics for model evaluation: Fairness metrics help evaluate whether the model treats all groups fairly and does not introduce harmful bias. When developing an LLM for document processing, it's essential to assess and mitigate any potential biases in the model's outputs to ensure that it operates responsibly and equitably, especially when the model interacts with sensitive data.
C. Modify the training data to mitigate bias: Bias in AI models often originates from biased training data. Modifying the training data to ensure it is representative and free from harmful biases is a crucial step in reducing the risk of the model producing unfair or harmful outcomes. This proactive approach is essential for responsible deployment.

Selected Answer: UC

Explicação:Quando uma empresa implementa um LLM (Large Language Model) para automação, especialmente em um setor sensível como contabilidade, é fundamental Garantir que o modelo aja de forma ética, justa e segura. Para isso, é importante:
A. Incluir métricas de imparcialidade para avaliação do modelo
→ Isso permite monitorar se o modelo está gerando respostas tendenciosas ou discriminatórias. Ajuda a garantir conformidade com princípios de IA responsável e regulamentos. C. Modificar os dados de treinamento para mitigar o viés
→ Ajustar ou balancear os dados ajuda a reduzir vieses aprendidos pelo modelo, evitando resultados distorcidos. Fundamental em contextos onde decisões automatizadas podem afetar pessoas ou negócios.

Selected Answer: UC

Explicação:
Desenvolver e implantar LLMs com responsabilidade envolve garantir que o modelo seja justo, ético, e evite causar danos involuntários. As duas práticas mais alinhadas com esse objetivo são:A. Incluir métricas de imparcialidade para avaliação do modelo.Avaliar a imparcialidade (fairness) garante que o modelo não gere resultados discriminatórios ou enviesados, especialmente importante em áreas sensíveis como contabilidade e finanças.
C. Modificar os dados de treinamento para mitigar o viés.O viés muitas vezes está nos dados. Corrigir ou balancear o conjunto de dados pode ajudar a reduzir decisões injustas ou distorcidas do modelo.

Selected Answer: AC

A: Include fairness metrics for model evaluation
Critical for responsible AI implementation
Helps identify discriminatory patterns
Ensures equitable treatment across different groups

Allows for continuous monitoring of fairness
Essential for an accounting firm handling sensitive financial data

C: Modify the training data to mitigate bias
Addresses bias at the source
Ensures representative training data
Helps prevent discriminatory outcomes
Critical for fair treatment of all clients
Fundamental to responsible AI development

Selected Answer: BE

A. no need for fairness metrics as the use case is for document processing
C. modifying the training data means there is a re-training of the model. not needed for this use case
D. there is no re-training needed for this case. avoiding overfitting is also not needed

Selected Answer: AC

A. Include fairness metrics for model evaluation: Fairness metrics help ensure that the model is not biased against any particular group. This is especially important in fields like accounting, where any biases in automated decisions could lead to unethical outcomes. Fairness metrics provide insight into how well the model treats all data groups equally.

C. Modify the training data to mitigate bias: Adjusting the training data to address any identified biases is crucial for developing responsible AI applications. This can involve balancing the dataset or removing biased samples, ensuring the model generalizes fairly across different data types and groups.
