EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 178
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A company is building an application for stock trading. The application needs sub-millisecond latency for processing trade requests. The company uses Amazon DynamoDB to store all the trading data that is used to process each trading request.

A development team performs load testing on the application and finds that the data retrieval time is higher than expected. The development team needs a solution that reduces the data retrieval time with the least possible effort.

Which solution meets these requirements?

A. Add local secondary indexes (LSIs) for the trading data.

B. Store the trading data in Amazon S3, and use S3 Transfer Acceleration.

C. Add retries with exponential backoff for DynamoDB queries.

D. Use DynamoDB Accelerator (DAX) to cache the trading data.

Selected Answer: D

DAX is an in-memory cache for DynamoDB that delivers fast read performance for your tables at scale by enabling you to get sub-millisecond response times for accessing your data. DAX is particularly beneficial for read-heavy and bursty workloads. Since it reduces the time to retrieve data, it's the most appropriate solution for achieving sub-millisecond latency in data retrieval.

Selected Answer: D

https://aws.amazon.com/dynamodb/dax/
DAX delivers up to a 10 times performance improvement—from milliseconds to microseconds—even at millions of requests per second.
only pay for the capacity you provision.
