EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 181
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A developer is troubleshooting an Amazon API Gateway API. Clients are receiving HTTP 400 response errors when the clients try to access an endpoint of the API.

How can the developer determine the cause of these errors?

A. Create an Amazon Kinesis Data Firehose delivery stream to receive API call logs from API Gateway. Configure Amazon CloudWatch Logs as the delivery stream's destination.

B. Turn on AWS CloudTrail Insights and create a trail. Specify the Amazon Resource Name (ARN) of the trail for the stage of the API.

C. Turn on AWS X-Ray for the API stage. Create an Amazon CloudWatch Logs log group. Specify the Amazon Resource Name (ARN) of the log group for the API stage.

D. Turn on execution logging and access logging in Amazon CloudWatch Logs for the API stage. Create a CloudWatch Logs log group. Specify the Amazon Resource Name (ARN) of the log group for the API stage.

Selected Answer: D

why not C,X-Ray is more focused on the internal workings and performance of the API rather than the validity or structure of incoming requests.according to the error 400,it should be the client side error like incorrect request syntax, invalid request message framing, or deceptive request routing

Selected Answer: D

Changing answer to D:
CloudTrail records API-level events, but it may not capture the payloads, headers, or other details of the requests and responses that are essential for understanding the cause of HTTP 400 response errors.
