Selected Answer: C

When using Amazon Bedrock, AWS is responsible for managing and securing the infrastructure that supports the service, including patching and updating the service itself. However, the company still has responsibility for securing its own data, both during transmission (in transit) and when it is stored (at rest). This includes ensuring that sensitive data is protected using encryption, access controls, and other security best practices as part of shared responsibility.

Selected Answer: C

C. Securing the company's data in transit and at rest

Explanation:
When using Amazon Bedrock, the company is responsible for securing its data both in transit and at rest. This involves ensuring the confidentiality and integrity of the data that is uploaded to Amazon Bedrock or transmitted to and from the service.
