EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 187
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A development team maintains a web application by using a single AWS RDS, template. The template defines web servers and an Amazon RDS database. The team uses the CloudFormation template to deploy the CloudFormation stack to different environments.

During a recent application deployment, a developer caused the primary development database to be dropped and recreated. The result of this incident was a loss of data. The team needs to avoid accidental database deletion in the future.

Which solutions will meet these requirements? (Choose two.)

A. Add a CloudFormation DeletionPolicy attribute with the Retain value to the database resource.

B. Update the CloudFormation stack policy to prevent updates to the database.

C. Modify the database to use a Multi-AZ deployment.

D. Create a CloudFormation stack set for the web application and database deployments.

E. Add a CloudFormation DeletionPolicy attribute with the Retain value to the stack.

Selected Answer: AB

A. Add a CloudFormation DeletionPolicy attribute with the Retain value to the database resource.

The DeletionPolicy attribute can be used in the CloudFormation template to protect a resource from being accidentally deleted. By setting the DeletionPolicy to Retain, the resource is retained when the stack is deleted, thus preventing accidental data loss. This should be applied directly to the database resource in the CloudFormation template.
B. Update the CloudFormation stack policy to prevent updates to the database.

A stack policy can be used to prevent changes to certain resources during stack updates. By defining a stack policy that prohibits actions on the database resource, the team can prevent accidental modifications or deletions of the database during stack updates.
