EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 189
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A company has an ecommerce application. To track product reviews, the company's development team uses an Amazon DynamoDB table.

Every record includes the following:

- A Review ID, a 16-digit universally unique identifier (UUID)
- A Product ID and User ID, 16-digit UUIDs that reference other tables
- A Product Rating on a scale of 1-5
- An optional comment from the user

The table partition key is the Review ID. The most performed query against the table is to find the 10 reviews with the highest rating for a given product.

Which index will provide the FASTEST response for this query?

A. A global secondary index (GSI) with Product ID as the partition key and Product Rating as the sort key

B. A global secondary index (GSI) with Product ID as the partition key and Review ID as the sort key

C. A local secondary index (LSI) with Product ID as the partition key and Product Rating as the sort key

D. A local secondary index (LSI) with Review ID as the partition key and Product ID as the sort key

Selected Answer: A

Rating for a product these two are essential and already ReviewID has partitions

Selected Answer: A

This GSI allows for queries that are based on Product ID, efficiently narrowing down the reviews for a specific product. The Product Rating as the sort key enables sorting the reviews by their rating, which directly supports the need to find the top 10 reviews. GSIs also support a different partition key than the base table, which is necessary in this case since the base table's partition key is Review ID.
