EXAM AWS CERTIFIED AI PRACTITIONER AIF-C01 TOPIC 1 QUESTION 92 DIS...

Exam question from Amazon's AWS Certified AI Practitioner AIF-C01

Question #: 92

Topic #: 1

[All AWS Certified AI Practitioner AIF-C01 Questions]

A software company builds tools for customers. The company wants to use AI to increase software development productivity.

Which solution will meet these requirements?

A. Use a binary classification model to generate code reviews.

B. Install code recommendation software in the company's developer tools.

C. Install a code forecasting tool to predict potential code issues.

D. Use a natural language processing (NLP) tool to generate code.

Selected Answer: D

NLP let developers write code from natural language prompts which increases software development.

Sesh_14 2 months, 3 weeks ago

Selected Answer: B

The goal is to increase software development productivity using AI. AI-powered code recommendation software (such as in-IDE coding assistants) directly supports developers by:

Suggesting code snippets and completions

Helping write tests and documentation

Reducing development time and errors

Integrating seamlessly into existing developer workflows

Why B is the best choice:

Focuses on developer productivity, not just code analysis

Requires minimal workflow changes

Provides immediate, practical benefits during coding

Selected Answer: B

Should be B

upvoted 2 times

samplunk 4 months, 1 week ago

Selected Answer: D

NLP-based AI tools (like GitHub Copilot or Amazon CodeWhisperer) can understand natural language prompts and generate code automatically, increasing developer productivity.

These tools help with writing new code, completing code snippets, or translating requirements into code.

B (Install code recommendation software) → Could help, but the core productivity boost comes from AI-driven code generation, not just recommendations.

Selected Answer: D

It is D..... How is B the answer for an AI test? Also you would have to know what tool to determine IF it would help productivity.

Selected Answer: D

A resposta correta é:D. Use uma ferramenta de processamento de linguagem natural (NLP) para gerar código. Explicação:
Ferramentas de Processamento de Linguagem Natural (NLP) aplicadas à geração de código — como Amazon CodeWhisperer, GitHub Copilot ou soluções baseadas em LLMs (Large Language Models) — permitem que os desenvolvedores escrevam código mais rapidamente, automatizem tarefas repetitivas e melhorem a produtividade.Essas ferramentas analisam prompts em linguagem natural e geram blocos funcionais de código, documentação, testes automatizados e muito mais.
B. Instale o software de recomendação de código nas ferramentas de desenvolvedor da empresa. É vago e não indica o uso de IA avançada ou NLP. Pode incluir sistemas manuais ou heurísticos.

Selected Answer: B

B. Install code recommendation software in the company's developer tools: Code recommendation tools can be helpful, but they are often focused on suggesting improvements or alternatives to existing code rather than generating new code from scratch. While useful, it may not provide the same level of productivity boost as an NLP-based code generation tool.

Selected Answer: B

As the company wants to increase software development productivity - B is the right one. i.e. Amazon Q Developer

upvoted 2 times

Moon 1 year, 3 months ago

Selected Answer: D

D. Use a natural language processing (NLP) tool to generate code is likely a more impactful solution for increasing productivity. Code recommendations are helpful, but direct code generation from natural language can automate larger portions of the coding process.

Selected Answer: B

Code Recommendation Software:

Code recommendation software, such as Amazon CodeWhisperer or similar tools, integrates directly into developer environments (e.g., IDEs). These tools use machine learning and AI to:
Suggest code snippets.
Autocomplete code based on context.
Improve developer productivity by reducing the time spent writing repetitive or boilerplate code.

may2021_r 1 year, 3 months ago

Selected Answer: B

The correct answer is B. Code recommendation tools integrated into developer environments provide immediate productivity benefits.

upvoted 1 times

aws_Tamilan 1 year, 3 months ago

Selected Answer: B

B. Install code recommendation software in the company's developer tools.

Explanation:
Code recommendation software integrates into developer tools (e.g., IDEs) and uses AI to analyze code context, provide intelligent code suggestions, automate repetitive tasks, and improve developer productivity. This approach directly aligns with the company's goal of increasing software development productivity.
---
why not choosing D:

While NLP-powered code generation is a promising area of research, it's not yet a foolproof solution for boosting productivity. Code recommendation tools, on the other hand, offer a more immediate and reliable way to enhance developer efficiency by streamlining the coding process.
