EXAM AWS CERTIFIED AI PRACTITIONER AIF-C01 TOPIC 1 QUESTION 94 DIS...

Exam question from Amazon's AWS Certified AI Practitioner AIF-C01

Question #: 94

Topic #: 1

[All AWS Certified AI Practitioner AIF-C01 Questions]

A large retail bank wants to develop an ML system to help the risk management team decide on loan allocations for different demographics.

What must the bank do to develop an unbiased ML model?

A. Reduce the size of the training dataset.

B. Ensure that the ML model predictions are consistent with historical results.

C. Create a different ML model for each demographic group.

D. Measure class imbalance on the training dataset. Adapt the training process accordingly.

Selected Answer: D

When developing an unbiased machine learning (ML) model, it's crucial to address issues like class imbalance in the training data. Class imbalance refers to the situation where certain classes (or demographic groups, in this case) are underrepresented compared to others. If class imbalance exists, the model might learn to favor the majority class and perform poorly on minority classes, leading to biased predictions.

Selected Answer: D

D. Measure class imbalance on the training dataset. Adapt the training process accordingly: This is the correct answer. Class imbalance occurs when one class (e.g., loan approval) is significantly more represented in the training data than another. This can lead to biased models that favor the majority class. Measuring and addressing class imbalance (e.g., through resampling or weighting techniques) is crucial for building fair models.

Why not B?
B. Ensure that the ML model predictions are consistent with historical results: If historical results reflect existing biases in lending practices, ensuring consistency with them will simply perpetuate those biases. This is the opposite of what is desired.

Selected Answer: D

The correct answer is D. Measuring and addressing class imbalance in training data is essential for developing unbiased ML models.

Selected Answer: D

D. Measure class imbalance on the training dataset. Adapt the training process accordingly.

Explanation:
To develop an unbiased ML model, it is crucial to ensure that the training dataset represents all demographic groups fairly and that the model is not influenced by biases in the data.
