Selected Answer: C

Using sam package (or aws cloudformation package) command, the developer can package the Lambda functions, along with any dependencies and resources defined in the SAM template, into a deployment package. This command uploads local artifacts (like Lambda function code and Swagger files) to an S3 bucket and produces a modified SAM template file, formatted for deployment.

Selected Answer: C

C. Bundle the serverless application using a SAM package.

Before deploying a serverless application using the AWS Serverless Application Model (AWS SAM) CLI, the developer should bundle the application using the sam package command. This command packages and uploads the local artifacts of your serverless application to Amazon S3, and it produces a packaged AWS SAM template file that you can deploy with the sam deploy command.
