EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 195
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A company wants to automate part of its deployment process. A developer needs to automate the process of checking for and deleting unused resources that supported previously deployed stacks but that are no longer used.

The company has a central application that uses the AWS Cloud Development Kit (AWS CDK) to manage all deployment stacks. The stacks are spread out across multiple accounts. The developer's solution must integrate as seamlessly as possible within the current deployment process.

Which solution will meet these requirements with the LEAST amount of configuration?

A. In the central AWS CDK application, write a handler function in the code that uses AWS SDK calls to check for and delete unused resources. Create an AWS CloudFormation template from a JSON file. Use the template to attach the function code to an AWS Lambda function and to invoke the Lambda function when the deployment stack runs.

B. In the central AWS CDK application, write a handler function in the code that uses AWS SDK calls to check for and delete unused resources. Create an AWS CDK custom resource. Use the custom resource to attach the function code to an AWS Lambda function and to invoke the Lambda function when the deployment stack runs.

C. In the central AWS CDK, write a handler function in the code that uses AWS SDK calls to check for and delete unused resources. Create an API in AWS Amplify. Use the API to attach the function code to an AWS Lambda function and to invoke the Lambda function when the deployment stack runs.

D. In the AWS Lambda console, write a handler function in the code that uses AWS SDK calls to check for and delete unused resources. Create an AWS CDK custom resource. Use the custom resource to import the Lambda function into the stack and to invoke the Lambda function when the deployment stack runs.

Selected Answer: B

This approach integrates directly into the existing AWS CDK deployment process. By writing a handler function within the CDK application, the developer can leverage the AWS SDK to programmatically identify and delete unused resources. The AWS CDK custom resource can then be used to invoke this function as part of the deployment process. This solution is efficient as it keeps everything within the CDK ecosystem and minimizes additional external configurations.

Selected Answer: B

The correct answer is (B).

Solution (B) is the best option because:

Requires the LEAST amount of configuration: Solution (B) uses an AWS CDK custom resource, which is a type of resource that can be defined in AWS CDK code. Custom resources are a convenient way to add custom functionality to your AWS CloudFormation stacks.
Integrates seamlessly into the current deployment process: Solution (B) uses the AWS CDK custom resource to attach function code to an AWS Lambda function and to invoke the Lambda function when the deployment stack runs. This means that the solution does not require any changes to the existing AWS CDK code.
