EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 213
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A developer needs to troubleshoot an AWS Lambda function in a development environment. The Lambda function is configured in VPC mode and needs to connect to an existing Amazon RDS for SQL Server DB instance. The DB instance is deployed in a private subnet and accepts connections by using port 1433.

When the developer tests the function, the function reports an error when it tries to connect to the database.

Which combination of steps should the developer take to diagnose this issue? (Choose two.)

A. Check that the function's security group has outbound access on port 1433 to the DB instance's security group. Check that the DB instance's security group has inbound access on port 1433 from the function's security group.

B. Check that the function's security group has inbound access on port 1433 from the DB instance's security group. Check that the DB instance's security group has outbound access on port 1433 to the function's security group.

C. Check that the VPC is set up for a NAT gateway. Check that the DB instance has the public access option turned on.

D. Check that the function's execution role permissions include rds:DescribeDBInstances, rds:ModifyDBInstance. and rds:DescribeDBSecurityGroups for the DB instance.

E. Check that the function's execution role permissions include ec2:CreateNetworkInterface, ec2:DescribeNetworkInterfaces, and ec2:DeleteNetworkInterface.

Selected Answer: AE

- A: The function needs outbound access to DB and the DB needs to allow inbound access from the function
- E: The function needs AWSLambdaVPCAccessExecutionRole role to work correctly in the VPC (https://docs.aws.amazon.com/lambda/latest/dg/configuration-vpc.html#vpc-permissions)

D is incorrect as the function's execution role does not need to make any of those DB actions: Describe Modify and DescribeDB security groups!

I believe It's A and D. Unsure on A, but D seems to be confirmed by this link: https://docs.aws.amazon.com/AmazonRDS/latest/UserGuide/lambda-rds-connect.html

Selected Answer: AE

A. Check that the function's security group has outbound access on port 1433 to the DB instance's security group. Ensure that the DB instance's security group has inbound access on port 1433 from the function's security group. This setup allows the Lambda function to initiate a connection to the DB instance through the specified port.

E. Check that the function's execution role permissions include ec2:CreateNetworkInterface, ec2:DescribeNetworkInterfaces, and ec2:DeleteNetworkInterface. These permissions are necessary for the Lambda function to create, manage, and clean up the network interfaces that allow it to connect to resources within a VPC, including the RDS instance.

Selected Answer: AE

AE

This is a network issue, not a governance issue, hence D is invalid.
Between A and B its an obvious choice.
C is invalid - DB is in a private subnet

Selected Answer: AE

Agree with Kaes

- A: The function needs outbound access to DB and the DB needs to allow inbound access from the function
- E: The function needs AWSLambdaVPCAccessExecutionRole role to work correctly in the VPC (https://docs.aws.amazon.com/lambda/latest/dg/configuration-vpc.html#vpc-permissions)

D is incorrect as the function's execution role does not need to make any of those DB actions: Describe Modify and DescribeDB security groups!

This is excellent. Thanks for the link. Makes it very clear.

Selected Answer: AD

We need connection between lambda and RDS, not to VPC. So, option E is unsuitable. We can choose the related remain option like D
About option A, it's already correct.
