Selected Answer: B

By using negative prompts, the company can reduce the generation of unrelated images by specifying what should not be included in the output, leading to more accurate and relevant image generation based on the given prompt.

Selected Answer: B

B. Use negative prompts.

Negative prompts help the model understand what to avoid in the generated images. By providing explicit instructions on what should not be included in the output, the model can better align its results with the intended themes and contexts of the prompts.
