Exam question from Amazon's AWS Certified Developer - Associate DVA-C02

Question #: 226

Topic #: 1

[All AWS Certified Developer - Associate DVA-C02 Questions]

Given the following AWS CloudFormation template:

```
Description: Creates a new Amazon S3 bucket for shared content. Uses a random bucket name to avoid conflicts.

Resources:

    ContentBucket:
        Type: AWS::S3::Bucket
    Outputs:

        ContentBucketName:
            Value: !Ref ContentBucket
```

What is the MOST efficient way to reference the new Amazon S3 bucket from another AWS CloudFormation template?

A. Add an Export declaration to the Outputs section of the original template and use ImportValue in other templates.

B. Add Exported: true to the Content.Bucket in the original template and use ImportResource in other templates.

C. Create a custom AWS CloudFormation resource that gets the bucket name from the ContentBucket resource of the first stack.

D. Use Fn::Include to include the existing template in other templates and use the ContentBucket resource directly.

By adding an Export declaration to the Outputs section of the original CloudFormation template, you can make the bucket name available for other templates to import and use. This allows you to reference the bucket name directly in other templates without the need for additional resources or custom logic.
