EXAM AWS CERTIFIED AI PRACTITIONER AIF-C01 TOPIC 1 QUESTION 135 DI...

Exam question from Amazon's AWS Certified AI Practitioner AIF-C01

Question #: 135

Topic #: 1

[All AWS Certified AI Practitioner AIF-C01 Questions]

HOTSPOT

-

A company wants to develop ML applications to improve business operations and efficiency.

Select the correct ML paradigm from the following list for each use case. Each ML paradigm should be selected one or more times.

Binary classification	Select... ▼ Supervised learning / Unsupervised learning
Multi-class classification	Select... ▼ Supervised learning / Unsupervised learning
K-means clustering	Select... ▼ Supervised learning / Unsupervised learning
Dimensionality reduction	Select... ▼ Supervised learning / Unsupervised learning

Binary classification
Supervised learning
(Binary classification involves predicting one of two classes, and it requires labeled data for training.)
Multi-class classification
Supervised learning
(Multi-class classification involves predicting one of multiple classes, and it also requires labeled data for training.)
K-means clustering
Unsupervised learning
(K-means clustering is a technique used to group data into clusters without labeled data, making it an unsupervised learning method.)
Dimensionality reduction
Unsupervised learning
(Dimensionality reduction techniques, such as PCA (Principal Component Analysis), are used to reduce the number of features in a dataset without labeled data, making it unsupervised.)

Below is the correct answer:

Supervise learning
Supervise learning
Unsupervised learning.
Unsupervised learning

Supervised Learning:
• Binary Classification: Requires labeled data (two classes) to train the model.
• Multi-Class Classification: Requires labeled data (more than two classes) to train the model.

Unsupervised Learning:
• K-means Clustering: Does not require labeled data; it identifies natural groupings in the data.
• Dimensionality Reduction: Typically unsupervised; it reduces the number of features based on the inherent structure of the data without using labels.

Binary classification - supervised learning
Multi-class classification - supervised learning

Both techniques involved training models with labeled data

K-means clustering - unsupervised learning
groups data based on similarity but not labels

Dimensionality reduction - unsupervised learning
aim to reduces number of features in dataset and does not need labels
