## EXAM AWS CERTIFIED AI PRACTITIONER AIF-C01 TOPIC 1 QUESTION 137 DI...

Exam question from Amazon's AWS Certified AI Practitioner AIF-C01

Question #: 137

Topic #: 1

[All AWS Certified AI Practitioner AIF-C01 Questions]

---

An ecommerce company is using a generative AI chatbot to respond to customer inquiries. The company wants to measure the financial effect of the chatbot on the company's operations.

Which metric should the company use?

A. Number of customer inquiries handled

B. Cost of training AI models

C. Cost for each customer conversation

D. Average handled time (AHT)

C is the correct answer as it most directly measures the financial impact of the chatbot on operations.

**Jessiii** 1 year, 1 month ago

**Selected Answer: C**

This metric directly relates to the financial impact of the chatbot by quantifying the cost associated with handling each customer interaction. By comparing this cost to the previous cost of handling inquiries (e.g., through human agents), the company can assess the financial efficiency and effectiveness of the chatbot.

**Selected Answer: C**

If "The company wants to measure the financial effect of the chatbot", the metric should be in terms of cost

**Selected Answer: D**

Average handled time (AHT) is a key metric for measuring operational efficiency impact.

- It directly correlates with operational costs (labor costs, system usage, etc.)
- It shows efficiency improvements that translate to financial savings
- It's a standard contact center metric that can be compared pre- and post-chatbot implementation
- Reduction in AHT directly shows cost savings through improved efficiency
- It captures the total financial impact better than just cost per conversation, as it factors in time savings which is a major component of operational costs

**Selected Answer: C**

Answer: C. Cost for each customer conversation

To measure the financial effect of a generative AI chatbot on an ecommerce company's operations, you want a metric that reflects the

cost impact of each interaction. “Cost for each customer conversation” captures how much the company is spending per inquiry handled by the chatbot. This lets you directly compare the chatbot’s operational expenses versus human-agent costs or other support channels.
