EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 246
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

An online sales company is developing a serverless application that runs on AWS. The application uses an AWS Lambda function that calculates order success rates and stores the data in an Amazon DynamoDB table. A developer wants an efficient way to invoke the Lambda function every 15 minutes.

Which solution will meet this requirement with the LEAST development effort?

A. Create an Amazon EventBridge rule that has a rate expression that will run the rule every 15 minutes. Add the Lambda function as the target of the EventBridge rule.

B. Create an AWS Systems Manager document that has a script that will invoke the Lambda function on Amazon EC2. Use a Systems Manager Run Command task to run the shell script every 15 minutes.

C. Create an AWS Step Functions state machine. Configure the state machine to invoke the Lambda function execution role at a specified interval by using a Wait state. Set the interval to 15 minutes.

D. Provision a small Amazon EC2 instance. Set up a cron job that invokes the Lambda function every 15 minutes.

Selected Answer: A

Amazon EventBridge (formerly known as CloudWatch Events) allows you to set up a rule with a specific schedule using cron or rate expressions. In this case, a rate expression of rate(15 minutes) can be used. EventBridge rules can directly target a Lambda function, making this a straightforward and low-effort solution to execute the function at regular intervals.

Selected Answer: A

Run Lambda as cron = Event Bridge

Selected Answer: A

option A is the most efficient and least development effort option for invoking the Lambda function every 15 minutes, as it leverages Amazon EventBridge's built-in scheduling capabilities and is fully serverless.
