## EXAM AWS CERTIFIED AI PRACTITIONER AIF-C01 TOPIC 1 QUESTION 166 DI...

Exam question from Amazon's AWS Certified AI Practitioner AIF-C01

Question #: 166

Topic #: 1

[All AWS Certified AI Practitioner AIF-C01 Questions]

---

Which scenario describes a potential risk and limitation of prompt engineering in the context of a generative AI model?

A. Prompt engineering does not ensure that the model always produces consistent and deterministic outputs, eliminating the need for validation.

B. Prompt engineering could expose the model to vulnerabilities such as prompt injection attacks.

C. Properly designed prompts reduce but do not eliminate the risk of data poisoning or model hijacking.

D. Prompt engineering does not ensure that the model will consistently generate highly reliable outputs when working with real-world data.

Selected Answer: B

AI-generated response (Claude):

B is the most correct answer.

Here's why each option stacks up:

B (best answer): Prompt injection is a real, well-documented, and specific security vulnerability where malicious input embedded in a prompt can override instructions or manipulate model behavior. It's a genuine risk introduced by or amplified through prompt engineering, making it a direct limitation of the practice itself.

D is also true in a general sense, but it's vague and describes a limitation of LLMs broadly, not specifically of prompt engineering as a practice. It doesn't point to a concrete risk.

Selected Answer: D

D) is exactly a key limitation of prompt engineering: no matter how well you craft prompts, generative AI outputs can still be inconsistent, unreliable, or biased in real-world scenarios. This directly describes a limitation and risk.

Selected Answer: D

D is correct because of: the model will NOT consistently generate highly reliable outputs when working with real-world data. AI Models aren't 100% deterministics.
Prompt engineering does not ensure that the model will consistently generate highly reliable outputs when working with real-world data.

Selected Answer: B

Engenharia de prompt (ou engenharia imediata) é o processo de projetar instruções (prompts) para orientar a saída de um modelo de IA generativa. No entanto, isso pode introduzir riscos de segurança, especialmente quando o modelo aceita entradas de usuários:

Um exemplo clássico é o ataque por injeção de prompt (prompt injection attack), onde o usuário maliciosamente insere comandos que "quebram" ou redirecionam a lógica original do prompt, levando o modelo a fornecer respostas incorretas, perigosas ou sensíveis.
