EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 258
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A developer is migrating an application to Amazon Elastic Kubernetes Service (Amazon EKS). The developer migrates the application to Amazon Elastic Container Registry (Amazon ECR) with an EKS cluster. As part of the application migration to a new backend, the developer creates a new AWS account. The developer makes configuration changes to the application to point the application to the new AWS account and to use new backend resources. The developer successfully tests the changes within the application by deploying the pipeline.

The Docker image build and the pipeline deployment are successful, but the application is still connecting to the old backend. The developer finds that the application's configuration is still referencing the original EKS cluster and not referencing the new backend resources.

Which reason can explain why the application is not connecting to the new resources?

A. The developer did not successfully create the new AWS account.

B. The developer added a new tag to the Docker image.

C. The developer did not update the Docker image tag to a new version.

D. The developer pushed the changes to a new Docker image tag.

Selected Answer: C

B probably intended to say 'a wrong tag' but not as clear as C.
