EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 263
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A developer manages three AWS accounts. Each account contains an Amazon RDS DB instance in a private subnet. The developer needs to define users in each database in a consistent way. The developer must ensure that the same users are created and updated later in all three accounts.

Which solution will meet these requirements with the MOST operational efficiency?

A. Create an AWS CloudFormation template. Declare the users in the template. Attach the users to the database. Deploy the template in each account.

B. Create an AWS CloudFormation template that contains a custom resource to create the users in the database. Deploy the template in each account.

C. Write a script that creates the users. Deploy an Amazon EC2 instance in each account to run the script on the databases. Run the script in each account.

D. Implement an AWS Lambda function that creates the users in the database. Provide the function with the details of all three accounts.

Selected Answer: B

CloudFormation itself does not natively manage database users within RDS. You would need a custom resource or some additional automation to create users within the RDS instance.
