EXAM AWS CERTIFIED AI PRACTITIONER AIF-C01 TOPIC 1 QUESTION 185 DI...

Exam question from Amazon's AWS Certified AI Practitioner AIF-C01

Question #: 185

Topic #: 1

[All AWS Certified AI Practitioner AIF-C01 Questions]

HOTSPOT

-

A company needs to customize a base model that is hosted on Amazon Bedrock.

Select the correct model customization method from the following list of company requirements. Each model customization method should be selected one or more times.

The company wants to improve the model's performance on specific tasks and examples. Select... (Select... / Continued pre-training / Fine-tuning)

The company wants to improve the model's domain knowledge by providing specific documents. Select... (Select... / Continued pre-training / Fine-tuning)

The company wants to retrain the model by using more unlabeled data over time. Select... (Select... / Continued pre-training / Fine-tuning)

✅ Fine-tuning
The company wants to improve the model's domain knowledge by providing specific documents. is fine tuning not pre-training. Pretraining refers to training a model from scratch on a large dataset to learn general features and representations. It is not focused on adapting to specific domain knowledge. Since the company already has a model and wants to improve its domain knowledge with specific documents, fine-tuning is the more suitable choice. Pretraining refers to training a model on a large general dataset before any specific task, which may not be as effective for domain-specific enhancements

The company wants to improve the model's performance on specific tasks and examples.
✅ Fine-tuning
(Fine-tuning adapts a pretrained model to perform better on a specific task by training it on task-specific labeled data.)

The company wants to improve the model's domain knowledge by providing specific documents.
✅ Continued pre-training
(Continued pre-training exposes the model to more unlabeled domain-specific data, enhancing its general understanding within that domain.)

The company wants to retrain the model by using more unlabeled data over time.
✅ Continued pre-training
(This technique helps the model learn from additional unlabeled data, often used to adapt to evolving language or domain shifts.)
