EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 269
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A developer is optimizing an AWS Lambda function and wants to test the changes in production on a small percentage of all traffic. The Lambda function serves requests to a RE ST API in Amazon API Gateway. The developer needs to deploy their changes and perform a test in production without changing the API Gateway URL.

Which solution will meet these requirements?

A. Define a function version for the currently deployed production Lambda function. Update the API Gateway endpoint to reference the new Lambda function version. Upload and publish the optimized Lambda function code. On the production API Gateway stage, define a canary release and set the percentage of traffic to direct to the canary release. Update the API Gateway endpoint to use the $LATEST version of the Lambda function. Publish the API to the canary stage.

B. Define a function version for the currently deployed production Lambda function. Update the API Gateway endpoint to reference the new Lambda function version. Upload and publish the optimized Lambda function code. Update the API Gateway endpoint to use the $LATEST version of the Lambda function. Deploy a new API Gateway stage.

C. Define an alias on the $LATEST version of the Lambda function. Update the API Gateway endpoint to reference the new Lambda function alias. Upload and publish the optimized Lambda function code. On the production API Gateway stage, define a canary release and set the percentage of traffic to

direct to the canary release. Update the API Gateway endpoint to use the $LATEST version of the Lambda function. Publish to the canary stage.

D. Define a function version for the currently deployed production Lambda function. Update the API Gateway endpoint to reference the new Lambda function version. Upload and publish the optimized Lambda function code. Update the API Gateway endpoint to use the $LATEST version of the Lambda function. Deploy the API to the production API Gateway stage.

Selected Answer: A

A.
API Gateway Canary deployment by using versions

upvoted 1 times

Shamalka 1 year ago

Selected Answer: A

The answer is A. If you read carefully, in option C, the endpoint is going to be printed to the $LATEST version all the time. So caranr would not be in effective

Selected Answer: A

```
# create Lambda version
aws lambda publish-version --function-name myFunction

# Update API Gateway
aws apigateway update-integration --rest-api-id api-id --resource-id
resource-id --http-method GET --patch-operations
op=replace,path=/uri,value=arn:aws:lambda:region:account-
id:function:myFunction:1

# Canary Deployments
{
"percentTraffic": 10,
"useStageCache": false
}
```

Selected Answer: C

Al definir un alias en la versión $LATEST de la función Lambda, el desarrollador puede referenciar este alias en el punto final de API Gateway. Luego, al cargar y publicar el código de función Lambda optimizado, se asegura de que la API Gateway haga referencia al nuevo alias de la función Lambda.

Después, en la etapa de producción de API Gateway, se puede definir una versión canary y establecer el porcentaje de tráfico que se dirigirá a la versión canary. Esto permite probar los cambios en producción en un pequeño porcentaje del tráfico sin cambiar la URL de API Gateway.

Selected Answer: C

A also looks good, C has an alias created and more like a practical way.
