EXAM AWS CERTIFIED AI PRACTITIONER AIF-C01 TOPIC 1 QUESTION 211 DI...

Exam question from Amazon's AWS Certified AI Practitioner AIF-C01

Question #: 211

Topic #: 1

[All AWS Certified AI Practitioner AIF-C01 Questions]

A company has developed a generative AI model for customer segmentation. The model has been deployed in the company's production environment for a long time. The company recently noticed some inconsistency in the model's responses. The company wants to evaluate model bias and drift.

Which AWS service or feature meets these requirements?

A. Amazon SageMaker Model Monitor

B. Amazon SageMaker Clarify

C. Amazon SageMaker Model Cards

D. Amazon SageMaker Feature Store

Selected Answer: B

What does SageMaker Clarify do?
SageMaker Clarify helps with:
✅ Detecting bias in training data and models
✅ Monitoring prediction drift
✅ Analyzing feature drift
✅ Explaining models (why does the model make these decisions?)

👉 It shows whether the model's behavior changes unfairly or unexpectedly over time.

Selected Answer: A

Bias is Clarify, Drift is Monitor. Should be Clarify for one option

Selected Answer: A

The best single answer for evaluating both model bias and drift in AWS is:

A. Amazon SageMaker Model Monitor

Model Monitor is designed for deployed models and can provide automated, ongoing evaluation of both data and model drift. It also integrates with tools to track potential bias, making it the most suitable feature for continuous monitoring in production environments. SageMaker Clarify specializes in bias analysis but is primarily used during model development and audit rather than ongoing production monitoring.

Selected Answer: A

Model Monitor is for ongoing monitoring, Clarify is used more during development

Selected Answer: A

A IS A CORRCT ANSWER

upvoted 1 times

e4bc18e 7 months, 3 weeks ago

Selected Answer: A

Sagemaker model monitor literally monitors models for drift over time. Clarify helps deal with bias on the data being used for models so it is A.

Selected Answer: B

This service monitors deployed models for data drift, model quality, and performance degradation over time. While it’s excellent for detecting drift in input data or model outputs, it doesn’t specifically focus on

evaluating bias in model predictions, which is a key requirement here.Clarify is designed to detect and measure bias in ML models (e.g., bias across demographic groups in customer segmentation) and explain model predictions. It also supports drift analysis by comparing model behavior over time, making it ideal for evaluating both bias and drift in the context of inconsistent responses.

Selected Answer: A

Amazon SageMaker Model Monitor is designed to:

Continuously monitor models in production

Detect data drift, model drift, and prediction quality issues over time

Alert you to inconsistencies between training data and real-world data

Help maintain model accuracy and fairness in production

Since the company is experiencing inconsistent responses from a long-deployed model, this is a classic use case for detecting drift and ensuring model stability.
