EXAM AWS CERTIFIED AI PRACTITIONER AIF-C01 TOPIC 1 QUESTION 227 DI...

Exam question from Amazon's AWS Certified AI Practitioner AIF-C01

Question #: 227

Topic #: 1

[All AWS Certified AI Practitioner AIF-C01 Questions]

A financial company has deployed an ML model to predict customer churn. The model has been running in production for 1 week. The company wants to evaluate how accurately the model predicts churn compared to actual customer behavior.

Which metric meets these requirements?

A. Root mean squared error (RMSE)

B. Return on investment (ROI)

C. F1 score

D. Bilingual Evaluation Understudy (BLEU) score

Selected Answer: C

The F1 score is the harmonic mean of precision and recall. It is particularly valuable when dealing with imbalanced datasets, such as customer churn prediction, where the number of customers who churn might be much smaller than those who do not churn.

Selected Answer: C

The F1 score is the most appropriate metric when evaluating a binary classification model like churn prediction, especially when there's an imbalance between the churn and non-churn classes.

✅ Why F1 Score?
Combines precision and recall into one score.

Useful when false positives and false negatives carry different costs (common in churn scenarios).

Helps measure how well the model is predicting both actual churners and non-churners.
