EXAM AWS CERTIFIED DEVELOPER - ASSOCIATE DVA-C02 TOPIC 1 QUESTIO...

Exam question from Amazon's AWS Certified Developer - Associate DVA-C02
Question #: 277
Topic #: 1
[All AWS Certified Developer - Associate DVA-C02 Questions]

A developer is designing a serverless application for a game in which users register and log in through a web browser. The application makes requests on behalf of users to a set of AWS Lambda functions that run behind an Amazon API Gateway HTTP API.

The developer needs to implement a solution to register and log in users on the application's sign-in page. The solution must minimize operational overhead and must minimize ongoing management of user identities.

Which solution will meet these requirements?

A. Create Amazon Cognito user pools for external social identity providers. Configure IAM roles for the identity pools.

B. Program the sign-in page to create users' IAM groups with the IAM roles attached to the groups.

C. Create an Amazon RDS for SQL Server DB instance to store the users and manage the permissions to the backend resources in AWS.

D. Configure the sign-in page to register and store the users and their passwords in an Amazon DynamoDB table with an attached IAM policy.

Selected Answer: A

Amazon Cognito es un servicio de AWS que permite agregar fácilmente la funcionalidad de registro e inicio de sesión a las aplicaciones. Puedes utilizar proveedores de identidades sociales externos, como Google, Facebook o Amazon, para permitir que los usuarios se registren e inicien sesión en tu aplicación.

Al crear grupos de usuarios en Amazon Cognito y asignar roles de IAM a esos grupos, puedes gestionar de manera eficiente los permisos y accesos de los usuarios a los recursos backend en AWS. Esto te permite minimizar los gastos operativos y la gestión continua de las identidades de los usuarios.
