EXAM AWS CERTIFIED AI PRACTITIONER AIF-C01 TOPIC 1 QUESTION 232 DI...

Exam question from Amazon's AWS Certified AI Practitioner AIF-C01

Question #: 232

Topic #: 1

[All AWS Certified AI Practitioner AIF-C01 Questions]

An education company is building a chatbot whose target audience is teenagers. The company is training a custom large language model (LLM). The company wants the chatbot to speak in the target audience's language style by using creative spelling and shortened words.

Which metric will assess the LLM's performance?

A. F1 score

B. BERTScore

C. Recall-Oriented Understudy for Gisting Evaluation (ROUGE)

D. Bilingual Evaluation Understudy (BLEU) score

Selected Answer: B

BERTScore uses semantic similarity instead of exact matches.

Selected Answer: B

B. BERTScore
Uses pretrained contextual embeddings (like BERT) to compare the semantic similarity between generated and reference texts.
More tolerant to variations in wording (e.g., spelling or paraphrasing) because it focuses on meaning, not exact word matches.
Good choice when you're dealing with creative language, such as the stylized way teenagers write.

B. Because it:
Evaluates semantic similarity, not just surface overlap.
Is robust to creative or non-standard language.
Fits the use case of capturing teenagers' creative spelling and slang.

Selected Answer: B

BLEU evaluates translation quality by comparing n-gram overlap between machine-generated and reference translations. It's designed for translation tasks and prioritizes exact matches, which doesn't align with assessing creative, stylistic text generation for a teenage audience.BERTScore measures the semantic similarity between generated text and reference text using contextual embeddings from a model like BERT. It's well-suited for evaluating generative tasks, as it captures how well the LLM's responses match the target style (e.g., teenage language with creative spelling and shortened words) by comparing them to reference responses. In an AWS context, BERTScore can be used with Amazon Bedrock's evaluation capabilities to assess the chatbot's output.

Selected Answer: D

The BLEU score is a commonly used metric for evaluating the quality of text generation in natural language processing, particularly when comparing machine-generated text to human-written reference outputs. It's especially useful when you want to assess how well a language model mimics a specific style or vocabulary — like teen language with creative spelling and abbreviations.
