EXAM AWS CERTIFIED AI PRACTITIONER AIF-C01 TOPIC 1 QUESTION 251 DI...

Exam question from Amazon's AWS Certified AI Practitioner AIF-C01

Question #: 251

Topic #: 1

[All AWS Certified AI Practitioner AIF-C01 Questions]

A design company is using a foundation model (FM) on Amazon Bedrock to generate images for various projects. The company wants to have control over how detailed or abstract each generated image appears

Which model parameter should the company modify?

A. Model checkpoint

B. Batch size

C. Generation step

D. Token length

Selected Answer: C

For image-generating foundation models (like Stable Diffusion-based models on Amazon Bedrock), the level of detail or abstraction in the generated image is primarily controlled by:

✔ Number of inference steps (generation steps)
• More steps → More detailed, sharper, more precise images
• Fewer steps → More abstract, less detailed, more impressionistic images

This directly matches the requirement.

Selected Answer: C

Why Generation Step Controls Image Detail
In the context of image generation using foundation models, the generation step parameter typically controls:

The number of iterations or refinement passes the model performs during image creation

How detailed, realistic, or abstract the final image appears

Fewer steps may result in more abstract or rough images, while more steps allow the model to add finer details and polish the output.

❌ Why the Other Options Don't Fit:
A. Model checkpoint: Refers to a saved state of the model during training—not a parameter for controlling image detail.

B. Batch size: Affects training efficiency and memory usage—not the quality or abstraction of generated images.

D. Token length: Relevant for text generation, not image generation.
