Exam question from Amazon's AWS Certified AI Practitioner AIF-C01

Question #: 261

Topic #: 1

[All AWS Certified AI Practitioner AIF-C01 Questions]

---

A company wants to identify groups for its customers based on the customers' demographics and buying patterns.

Which algorithm should the company use to meet this requirement?

A. K-nearest neighbors (k-NN)

B. K-means

C. Decision tree

D. Support vector machine

## Comments

**gonzales** 4 months, 1 week ago

**Selected Answer: B**

K-means clustering

It groups customers into segments based on similarity.
Without predefined labels

**Selected Answer: B**

• A. K-nearest neighbors (k-NN)
Supervised classification algorithm. Needs labeled data to classify new data points.
❌ Not suitable for pure grouping/clustering.
• B. K-means
Classic unsupervised clustering algorithm. It automatically groups data points (customers) into clusters based on similarity of features (like demographics, buying patterns).
✅ Perfect fit
• C. Decision tree
Supervised learning, used for classification or regression. Needs labeled training data.
❌ Not suitable.
• D. Support vector machine (SVM)
Primarily a supervised algorithm for classification or regression.
❌ Not suitable.

✅ Correct answer: B. K-means
